## Medium-Fi Prototype ReadMe

### **Medium-Fi Prototype:**

<https://tinyurl.com/4xj5cadw>

### **What is RendezViewz?**

RendezViewz is a media sharing app that leverages the ease and social aspects of listing and ranking shows to engage users and spark interactions surrounding TV/movies. Inspired by friends' sharings, one can then easily arrange virtual or in-person watch sessions.

### **Tagline:**

Life of the watch party!

### **Who are we?**

Yishu Chen, Allen Naliath, Francis Santiago, Charlotte Zhu

### **How can you use our prototype?**

We used Figma to build and present our prototype. Figma is a wireframing/prototyping tool that is commonly used in the UI/UX space to demonstrate mockups of applications.

Using our link, you will be redirected to our Figma file, and from there, you can click the Present button in the upper right side of the page (looks like a play button). From there, you should be able to use the app like you would a mobile application, using your mouse to navigate through the design. Enjoy!

### **Task Flows:**

1. Navigate to the Map: Using the first Task Flow on the left-hand side, click the Map View tab on the upper part of the screen to see a map view of where your friends are.
  - a. BONUS: Click the friend on the upper left and like their third post by navigating through posts with the arrow buttons.
2. Add/Rank a Show: Using the second Task Flow on the left-hand side, click the clipboard at the bottom of the screen to reveal the navigator. Click the plus button to open the interface. Click the search bar to open the keyboard, click the keyboard to enter hardcoded text, and click The Shining to auto-complete the

search. Enter 5 by clicking the numbers option, clicking 5, and hitting enter. From there, confirm your selection.

3. **Scheduling:** Using the third Task Flow on the left-hand side, navigate to the calendar through the clapboard on the bottom, and click the scheduling icon in the top right corner. From there, you can navigate to see your scheduled appointments. Schedule a group watching session 3 months from now! To see which buttons are active and can guide you through the process, click the screen at any time to highlight the active buttons.

#### **Limitations: What have we left out?**

- **Friend's Profile Page:** the shared preference and wishlists.
- **Add Friend:** how does one add more friends in the app?
- **Movie pages:** we have yet to make movie pages and add the map view to the show progression
- **More color/font coordination:** we haven't had time to coordinate font colors fully between task flows

#### **Hard-Coded and Wizard of Oz: What will be better in the final version?**

- **Dynamic Map:** Map with users' current location
- **Authentication:** User sign up & log in process
- **Algorithm:**
  1. Recommendation algorithm that decides what posts to show in the user's feed page
  2. Matching algorithm that returns the shared preference & wish list of a user and their friend
- **Calendar:** for the user to schedule group watch based on the availability of multiple users and send out invitations.
