Branch and Bound Examples

Prof. S. Boyd, EE392o, Stanford University

Example from control theory

- function minimized is complicated, non-convex function that arises in control theory (stability degree)
- lower and upper bound evaluated using sophisticated methods (convex optimization, control theory)
- problem instance has 5 variables

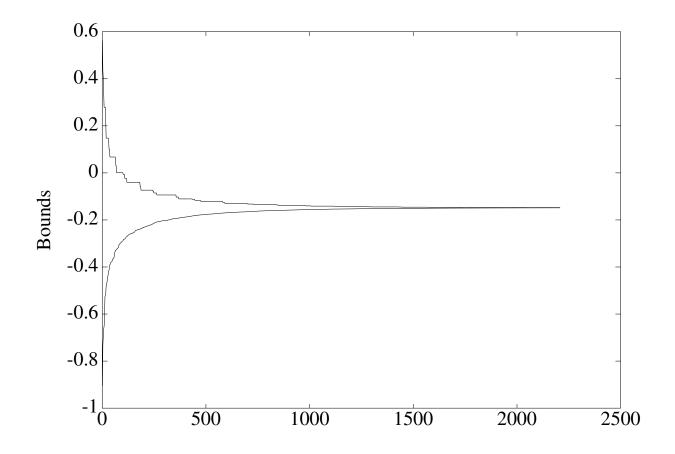

Figure 1: Upper and lower bound versus number of iterations.

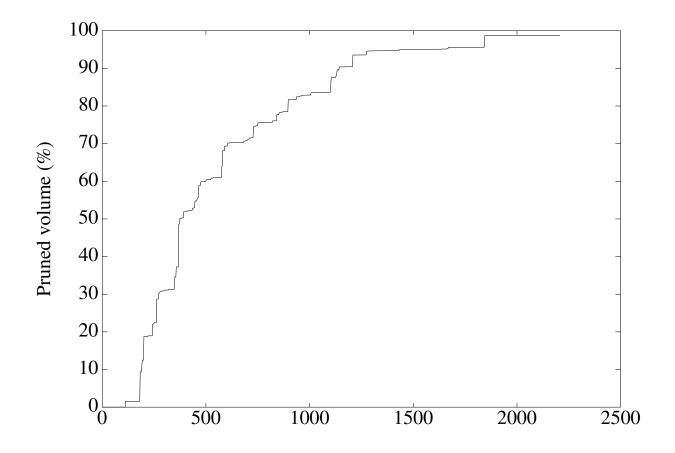

Figure 2: Pruned volume versus number of iterations.

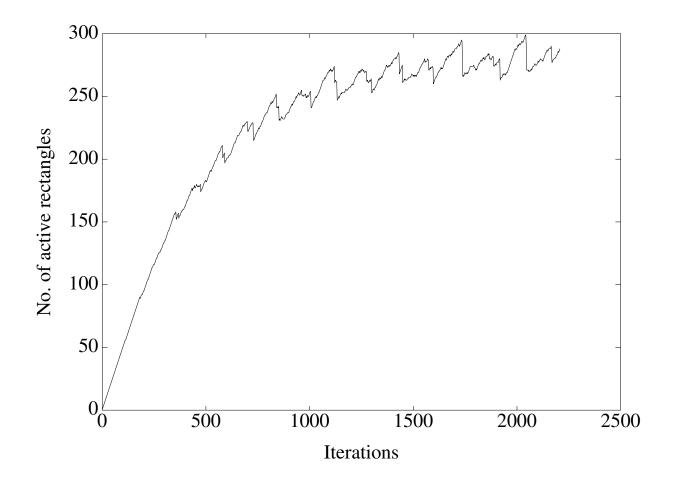

Figure 3: Active rectangles versus number of iterations.

- approximately 1000 iterations to prune 82% of the volume.
- \bullet approximately 2000 iterations to find global solution within 0.001

Example of mixed Boolean-convex problem

We consider the problem

$$\begin{array}{ll} \text{minimize} & c^T z\\ \text{subject to} & d^T z \leq -1,\\ & z_j \in \{0,1\}, \quad j=1,\ldots,n, \end{array}$$

where

$$c = (1.1, -2.2, 3.4, -3.7, 6), \qquad d = (-1.1, -2.2, -3.4, 3.2, 5)$$

(easily solved; this is just to illustrate branch and bound)

- split node with lowest lower bound
- fix variable closest to either 0 or 1 in the relaxation, or with largest dual variable among those equal to 0 or 1
- algorithm terminates in 10 steps (cf. 32 for exhaustive search)

$$(0.5, 0.8)$$

$$z_{4} = 0$$

$$z_{4} = 1$$

$$(1, +\infty)$$

$$z_{5} = 0$$

$$(0.5, 0.8)$$

$$z_{5} = 1$$

$$(6.8, +\infty)$$

$$(0.5, 0.8)$$

$$z_{3} = 0$$

$$(1, +\infty, +\infty)$$

$$(0.5, 0.8)$$

$$z_{2} = 0$$

$$(0.5, 0.8)$$

$$(1, +\infty, +\infty)$$

$$z_{1} = 0$$

$$(1, +\infty, +\infty)$$

$$z_{1} = 1$$

$$(0.8, 0.8)$$

$$(1, +\infty, +\infty)$$
