THE RISE OF NOVA

Tufts
UNIVERSITY

OUTLINE

- Neutrino Oscillations
- NuMI Beam
- Bi-probability plot
- NOvA Experiment
- Numu Disappearance
- Nue Appearance
- What to expect

NEUTRINO OSCILLATION

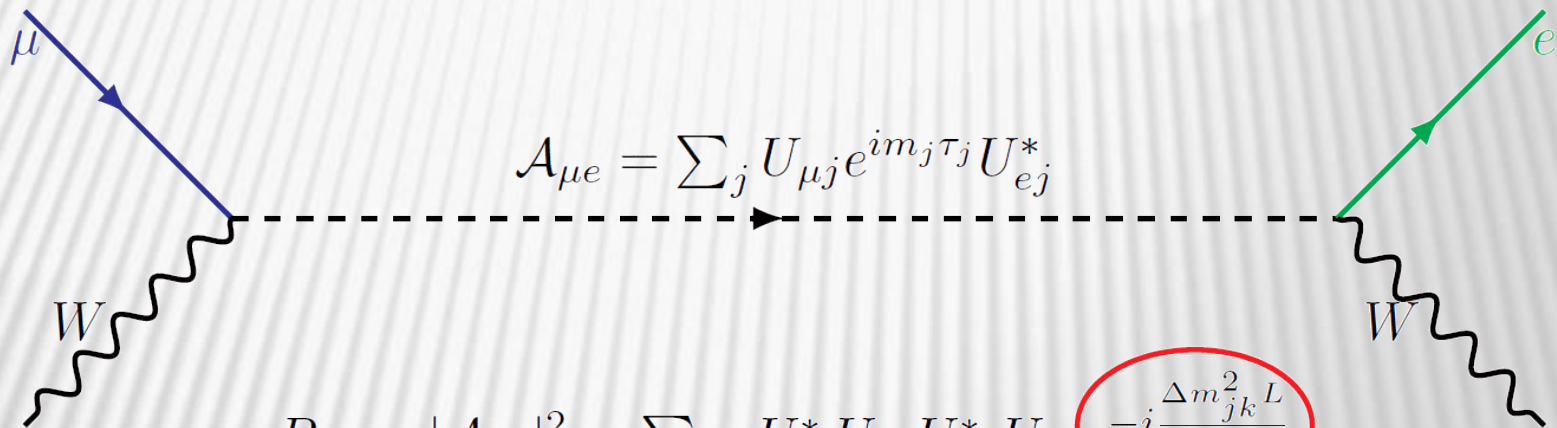

NEUTRINO OSCILLATION

NEUTRINO OSCILLATION

$$U = \begin{bmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{bmatrix} \begin{bmatrix} c_{13} & 0 & s_{13}e^{-i\delta_{CP}} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta_{CP}} & 0 & c_{13} \end{bmatrix} \begin{bmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$P_{\mu e} = |A_{\mu e}|^2 = \sum_{j,k} U_{e j}^* U_{\mu j} U_{\mu k}^* U_{e k} e^{-i \frac{\Delta m_{jk}^2 L}{2E}}$$

Oscillation

$$U(\theta_{12}, \theta_{13}, \theta_{23}, \delta_{CP})$$

In general: $n(n-1)/2$ angles and $(n-1)(n-2)/2$ phases

NEUTRINO OSCILLATION

$$U = \begin{bmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{bmatrix} \begin{bmatrix} c_{13} & 0 & s_{13}e^{-i\delta_{CP}} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta_{CP}} & 0 & c_{13} \end{bmatrix} \begin{bmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

ases

NEUTRINO OSCILLATION

$$A_{\mu e} = \sum_j U_{\mu j} e^{im_j \tau_j} U_{ej}^*$$

NEUTRINO OSCILLATION

$$A_{\mu e} = \sum_j U_{\mu j} e^{im_j \tau_j} U_{ej}^*$$

NEUTRINO OSCILLATION

$$A_{\mu e} = \sum_j U_{\mu j} e^{im_j \tau_j} U_{ej}^*$$

NEUTRINO OSCILLATION

$$A_{\mu e} = \sum_j U_{\mu j} e^{im_j \tau_j} U_{ej}^*$$

NEUTRINO OSCILLATION

NEUTRINO OSCILLATION

- Flip CP \implies Flip T (CPT theorem)
- Triangle is not symmetric (CP violation)

NEUTRINO OSCILLATION

- $\nu_\alpha \rightarrow \nu_\alpha$ is T invariant, so it must be CP invariant (CPT theorem)
- Also, only even orders in $\Delta \equiv \Delta m^2 L/E$

ν_μ Disappearance

$$\mathcal{P}(\nu_\mu \rightarrow \nu_\mu) \approx 1 - \sin^2(2\theta_{\mu\mu}) \sin^2 \Delta_{\mu\mu} + \mathcal{O}(\Delta_{21})^2$$

$\theta_{\mu\mu} \sim \theta_{23}$ symmetry

$\Delta m^2_{\mu\mu} \sim \Delta m^2_{32}$ symmetry

ν_e Appearance

$$\begin{aligned} \mathcal{P}(\nu_\mu \rightarrow \nu_e) &\approx \sin^2 \theta_{23} \sin^2(2\theta_{13}) \sin^2 \Delta_{\mu e} \\ &\pm \tilde{J} \sin \delta \sin \Delta_{21} \sin^2 \Delta_{\mu e} + \mathcal{O}(\Delta_{21})^2 \end{aligned}$$

CP violation ($\sin \delta$ term)

Breaks θ_{23} symmetry

Different effective Δm^2

GOING THROUGH THE EARTH

- Earth is transparent to neutrinos
- It has a neutrino “refractive index”
- Main effect is change in θ_{13}

$$A \equiv \frac{\sqrt{2}G_F n_e}{\Delta m_{32}^2/2E} \sim \frac{E}{11.5 \text{ GeV}}$$

$$\tan(2\tilde{\theta}_{13}) \equiv \frac{\sin(2\theta_{13})}{\cos(2\theta_{13}) - A}$$

- Depends on sign of Δm_{32}^2
- Different signs for ν and $\bar{\nu}$
- Apparent CP violation

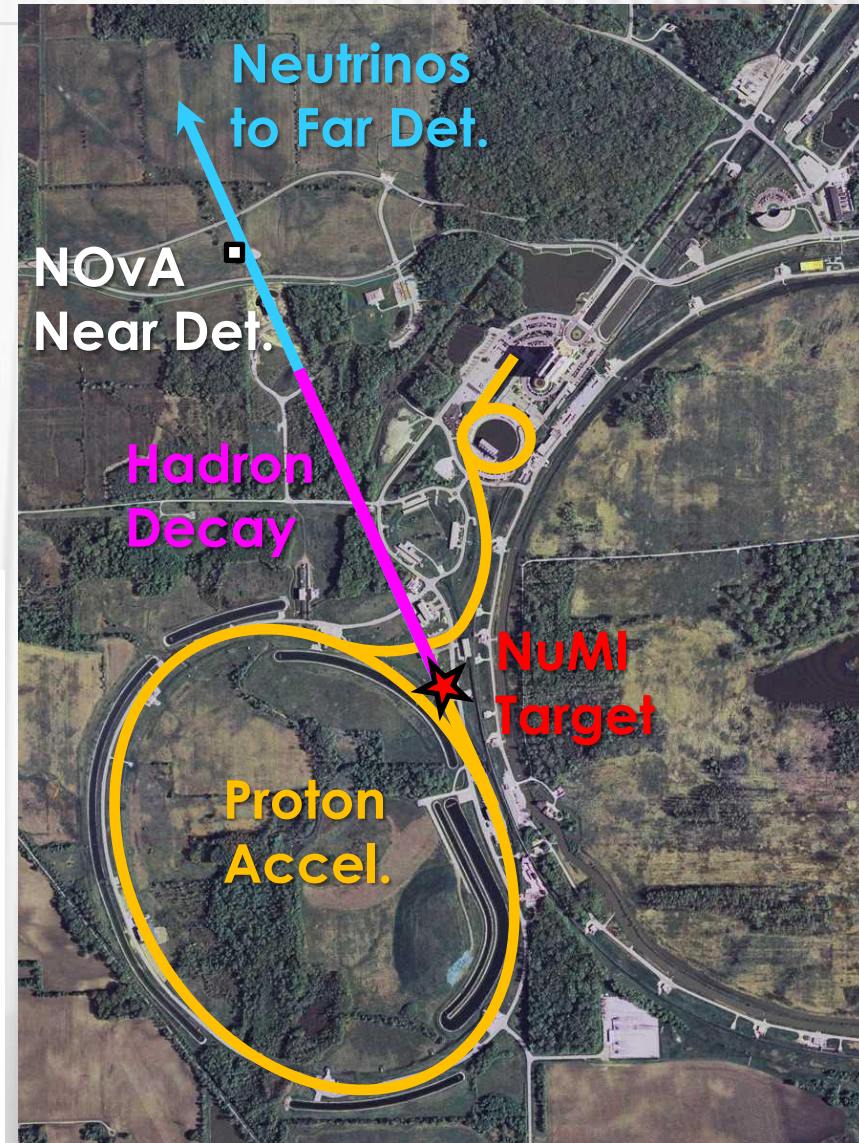

THE NUMI BEAM

RAMPING UP

- Capable of 700 kW
- Currently at ~470 kW
- Full power by mid 2016
- 6.4×10^{20} PoT delivered

Total MINOS+/NOvA protons to 00:00 Monday 06 July 2015

Reconstruct vertex and clusters

NUMU DISAPPEARANCE

NOVA TOPOLOGIES

NC REJECTION

COSMIC REJECTION

Selection	ν_{μ} -CC Signal	NC Background	Cosmics
No Cuts	127	380	19.1 M
Containment	109	195	120 k
NC Rejection	86	5	44 k
Cosmics Rejection	75	4	1

- Track information used in BDT
- Achieve a 19M : 1 rejection ratio
- Numbers based on 1 nominal year (6×10^{20} PoT x 14 kt)

NUMU DISAPPEARANCE

NOvA Simulation

- Clear oscillation signal
- Excellent resolution of oscillation dip
- $\sim 1\%$ precision on $\sin^2(2\theta_{23})$

NUMU DISAPPEARANCE

- Will test maximal mixing
- MINOS-T2K discrepancy
- First results may give some hints, but will not be conclusive

NUE APPEARANCE

NOVA TOPOLOGIES

NOvA Monte Carlo

FINDING NUE'S

Library Event Matching

- Compare hit distribution with a library of MC simulated events
- Perform multivariate analysis on properties of best matches to event

Likelihood ν_e Identifier

- Compare LogL of energy deposition with different particle assumptions
- Perform multivariate analysis on LogL differences and shower properties

COSMIC REJECTION

Cosmic Background*	LID	LEM
No Cuts	15 M	15 M
Containment	0.6 M	1 M
Cosmics Rejection	5 k	6 k
Preselection	40	60
PID	0.3	0.3

*Based on 96 live-seconds

- Cosmic rejection essential
- Similar performance from both selection methods
- Achieve a 50M : 1 rejection ratio

HOW MANY?

- Far detector predictions are corrected using near detector data
- Predictions are scaled to a full detector exposure equivalent to approx. 1/2 nominal year, representative of expected first results
- The oscillation model assumed no matter effect and:
 - $\delta_{CP} = 0$
 - $\sin^2 2\theta_{13} = 0.095$

PRELIMINARY

	Osc. ν_e -CC	Total Bkg.	ν_μ -CC	NC	Beam ν_e -CC	Cosmics
LEM	4.7	1.5	0.07	0.5	0.5	0.4
LID	4.4	1.3	0.07	0.4	0.4	0.4

WHAT TO EXPECT

THE TENSION

$\sin^2(2\theta_{13}) \sim 0.1$

T2K

WHAT WE KNOW

Normal Ordering
Inverted Ordering

$$|\Delta m_{32}^2| = 2.32 \cdot 10^{-3} \text{ eV}^2$$

$$\sin^2(2\theta_{13}) = 0.095$$

$$\sin^2(2\theta_{23}) = 0.97$$

WHAT WE'LL FIND OUT

DISCLAIMER: NO OFFICIAL NOvA DATA OR SIMULATION USED IN THESE PLOTS.

- **What if NOvA sees 6 events?**
- Average expectation
- Lower than T2K
- **No clear answer** on mass ordering, but still prefer maximal CP violation due to T2K

Normal Ordering
Inverted Ordering

WHAT WE'LL FIND OUT

DISCLAIMER: NO OFFICIAL NOvA DATA OR SIMULATION USED IN THESE PLOTS.

- **What if NOvA sees 9 events?**
- Higher than expected
- Similar to T2K
- Some tension with standard oscillation
- **Improved sensitivity** to mass ordering, θ_{23} octant and CP violation

Normal Ordering
Inverted Ordering

WHAT WE'LL FIND OUT

DISCLAIMER: NO OFFICIAL NOvA DATA OR SIMULATION USED IN THESE PLOTS.

- What if NOvA sees **3 events**?
- Lower than expected
- Opposite of T2K
- Relatively strong **tension** with standard oscillation picture

Normal Ordering
Inverted Ordering

THE END GOAL

Normal Ordering
Inverted Ordering

NOVA ♥ T2K

Normal Ordering
Inverted Ordering

SUMMARY

- NOvA will be releasing exciting first results in the upcoming weeks
- About half a nominal year of full detector equivalent data already collected ($\sim 3 \times 10^{20}$ PoT)
- Predict anywhere from 3 to 9 candidate ν_e events depending on exact oscillation parameters
- Will NOvA prefer MINOS or T2K?
- Place your bets!

BACKUP SLIDES

NON-STANDARD INTERACTIONS

$$H = U_{PMNS} \begin{bmatrix} 0 & 0 & 0 \\ 0 & \frac{\Delta m_{21}^2}{2E} & 0 \\ 0 & 0 & \frac{\Delta m_{31}^2}{2E} \end{bmatrix} U_{PMNS}^\dagger + V_e \begin{bmatrix} 1 + \epsilon_{ee} & \epsilon_{e\mu} & \epsilon_{e\tau} \\ \epsilon_{e\mu}^* & \epsilon_{\mu\mu} & \epsilon_{\mu\tau} \\ \epsilon_{e\tau}^* & \epsilon_{\mu\tau}^* & \epsilon_{\tau\tau} \end{bmatrix}$$

- What if there are new interactions?
- Change in refractive index
 - Extra CP violation
 - Larger parameter space
- NOvA will have world leading sensitive to these NSI effects

NON-STANDARD INTERACTIONS
