

# “Laboratory vs. Field Experiments: What Can We Learn?”

Comments on Levitt-List paper  
by **Al Roth**

Roundtable discussion, ASSA  
meetings, Boston, January 8, 2006.

I like **both** lab and field experiments

In particular, I’m a great admirer of  
John’s work.

# Many points of agreement

- I certainly agree that we must be careful in interpreting and generalizing the results of experiments.
- But some of the terms of the discussion strike me as a bit skewed, and may obscure areas of broad agreement.
- For example, the titles...

# “Laboratory **versus** field experiments”

- The title of our session seems like an odd way to talk about complementary goods.
  - Lab and field experiments are complements not only with each other, but also with other kinds of empirical and theoretical work

# “What Do Laboratory Experiments Tell Us About the Real World?”

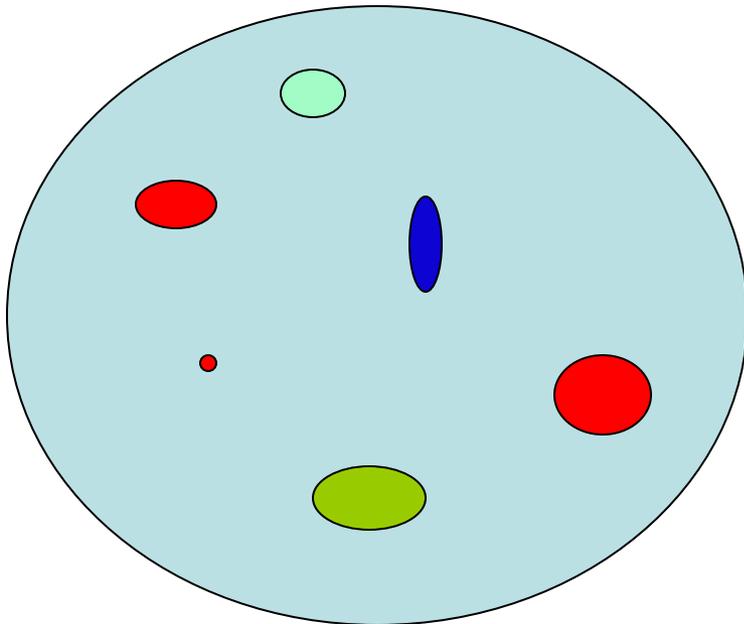

- I’m puzzled by what seems to be the implied *geography* of the Levitt-List paper.

# Implicit geography of lab and world:

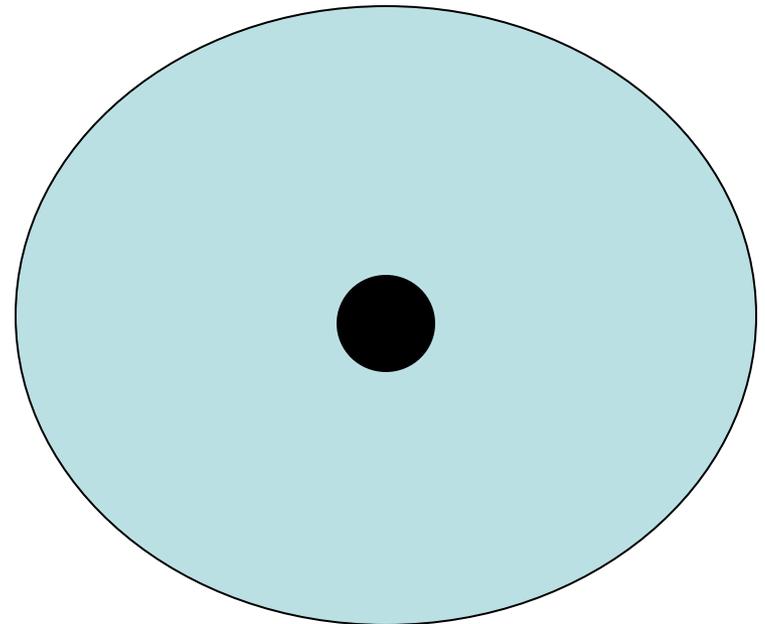

many points in lab space, only one in real world (and so no questions about robustness of observations except in the lab...)

- Lab experiments

(experimental conditions)

“Real World”

# Recap:

- There are more generalizations to worry about than just from lab to real world
  - I fully agree that over-exuberant generalization is one of the things that most reduces the pleasure of reading an economics paper (whether the paper is a lab or field experiment, another kind of field study, or a theory paper...)
- I even agree that lab and field experiments may have different comparative advantage

# Some things at which lab experiments excel

- Testing theoretical propositions
  - While controlling for the assumptions of the theory
- Abstracting away from the complexities of field data.
  - Whispering in the ears of princes

# Some examples from market design

- Several of the clearinghouse markets I've helped design are similar from the point of view of the underlying economic theory
  - American and Canadian markets for medical residents (1998)
    - The same clearinghouse mechanism has subsequently been adopted by Postdoctoral Dental Residencies, Psychology Internships, Neuropsychology Residencies, Osteopathic Internships, Pharmacy Practice Residencies, Articling Positions with Law Firms in Alberta.
  - New York City high school matching (2003)
  - Boston public school matching (2006)
  - Gastroenterology match (2006)
- These different markets are all *different* points in the “real” world. How to draw some general conclusions about them?

| Market                                     | Stable     | Still in use (halted unraveling) |
|--|------------|----------------------------------|
| • NRMP                                     | yes        | yes (new design in '98)          |
| • <i>Edinburgh ('69)</i>                   | <i>yes</i> | <i>yes</i>                       |
| • <i>Cardiff</i>                           | <i>yes</i> | <i>yes</i>                       |
| • <i>Birmingham</i>                        | <i>no</i>  | <i>no</i>                        |
| • <i>Edinburgh ('67)</i>                   | <i>no</i>  | <i>no</i>                        |
| • <i>Newcastle</i>                         | <i>no</i>  | <i>no</i>                        |
| • <i>Sheffield</i>                         | <i>no</i>  | <i>no</i>                        |
| • Cambridge                                | no         | yes                              |
| • London Hospital                          | no         | yes                              |
| • Medical Specialties                      | yes        | yes (~30 markets, 1 failure)     |
| • Canadian Lawyers                         | yes        | yes (Alberta, no BC, Ontario)    |
| • Dental Residencies                       | yes        | yes (5 ) (no 2)                  |
| • Osteopaths (< '94)                       | no         | no                               |
| • Osteopaths ( $\geq$ '94)                 | yes        | yes                              |
| • Pharmacists                              | yes        | yes                              |
| • Reform rabbis yes (first used in '97-98) |            | yes                              |
| • Clinical psych yes (first used in '99)   |            | yes                              |

So stability looks like an important feature in the success of a centralized labor market clearinghouse, based on diverse field observations.

# The need for experiments

- How to know if the difference between stable and unstable matching mechanisms is the key to success?
  - There are other differences between e.g. Edinburgh and Newcastle
  - There are even bigger differences between British medical labor markets and
    - American medical and other health care markets
    - School matching

# Simple laboratory experiments help show stability of the algorithm is critical

- Kagel, John H. and A.E. Roth, "The dynamics of reorganization in matching markets: A laboratory experiment motivated by a natural experiment," *Quarterly Journal of Economics*, February, 2000, 201-35.)
  - Compares stable versus unstable mechanisms (those used in Edinburgh and Newcastle) in a market with no other differences (and just 6 subjects on each side of the market)
  - The virtue of the experiment is not that it reproduces the markets in Edinburgh and Newcastle, let alone the American medical or other markets.
  - Instead, it gives a simple, transparent comparison in which the only variable is the clearinghouse mechanism.
    - So it clarifies the effect of the mechanism in a way none of the field comparisons could.

| Market                       | Stable                     | Still in use (halted unraveling) |
|------------------------------|----------------------------|----------------------------------|
| • NRMP                       | yes                        | yes (new design in '98)          |
| • <i>Edinburgh ('69) yes</i> |                            | <i>yes</i>                       |
| • <i>Cardiff</i>             | <i>yes</i>                 | <i>yes</i>                       |
| • <i>Birmingham</i>          | <i>no</i>                  | <i>no</i>                        |
| • <i>Edinburgh ('67) no</i>  |                            | <i>no</i>                        |
| • <i>Newcastle</i>           | <i>no</i>                  | <i>no</i>                        |
| • <i>Sheffield</i>           | <i>no</i>                  | <i>no</i>                        |
| • Cambridge                  | no                         | yes                              |
| • London Hospital            | no                         | yes                              |
| • Medical Specialties        | yes                        | yes (~30 markets, 1 failure)     |
| • Canadian Lawyers           | yes                        | yes (Alberta, no BC, Ontario)    |
| • Dental Residencies         | yes                        | yes (5 ) (no 2)                  |
| • Osteopaths (< '94)         | no                         | no                               |
| • Osteopaths ( $\geq$ '94)   | yes                        | yes                              |
| • Pharmacists                | yes                        | yes                              |
| • Reform rabbis              | yes (first used in '97-98) | yes                              |
| • Clinical psych             | yes (first used in '99)    | yes                              |
| • <b>Lab experiments</b>     | <b>yes</b>                 | <b>yes.</b>                      |
|                              | <b>no</b>                  | <b>no</b>                        |

**Lab experiments fit nicely on the list, just more of a variety of observations that increase our confidence in the robustness of our conclusions, the lab observations are the smallest but most controlled of the markets on the list...**

# Lab experiments can be tailored to help generalize other complex phenomena observed in the field

- For the gastroenterology market:
  - C. Nicholas McKinney, Muriel Niederle, and Alvin E. Roth, “The collapse of a medical labor clearinghouse (and **why such failures are rare**),” *American Economic Review*, 95, 3, June, 2005, 878-889.
- For schools:
  - Y. Chen and T. Sönmez “School Choice: An Experimental Study,” *Journal of Economic Theory*, forthcoming.
- For decentralized markets:
  - Niederle, Muriel and Alvin E. Roth, “Market Culture: How Norms Governing Exploding Offers Affect Market Performance,” working paper.
- *These experiments don't simply elicit behavior that generalizes to natural markets, but they do it in environments so simple and controlled that **causality** can be inferred, from within-experiment comparisons.*

# In conclusion

- Broad agreement:
  - generalizations must be made carefully
    - From experiments and from field observations
- Field and laboratory experiments both add to our ability to understand the (“real”) world
- **Series** of experiments, and **varieties** of observations help us understand what is robustly generalizable.

# Alternative geography of the “real world”

(generalization is no less an issue in the field)
