A Science of the Mind

In the 17th century physics was a new frontier of science. In the 18th century chemistry had the same excitement. In the latter half of the 20th century, a new science has emerged. The same sense of adventure inspires some of the brightest minds to explore this new frontier: the study of symbolic systems.

Symbolic Systems attacks age-old questions about the relation between mind and the world, questions like the following. What is information? What is intelligence? How are they related? Is intelligence more than information processing? Does intelligence require a mind? For that matter, what is a mind? How are minds related to brains? Does intelligence require some sort of biologically-based brain? Or is it possible to create artifacts that process information in a way that we can call them intelligent?

What is the relation of mind to the external world? Is the world a creation of mind? Or does the mind explore and discover facts about an independently existing world? Or is there no relation between the two? What does it mean to refer to consciousness? And how does language and meaning fit into the picture? How do thoughts about language bear on form, representation, or truth?

These questions have puzzled thinkers for thousands of years. But beginning in the 1950s, scientists from a number of disciplines began to converge on a scientific approach to these puzzles.

Probably the most significant single factor in this new field is the development of the electronic computer, dating back to work by the logician Alan Turing. Turing directly challenged consciousness through the inverse problem: for a while he believed that it should be possible to create a machine that was capable of full-fledged thought. Although Turing’s dream is far from realized, his work led to major steps in the development of the modern computer.

The computer has launched the study of mind, information, and intelligence into a new era in much the same way that Galileo’s use of the telescope launched the new science of astronomy. By allowing us to build powerful simulations of various kinds of intelligent action, it provides a methodology for the rigorous probing of questions about the nature of mind, meaning, and intelligence.

But in the Symbolic Systems Program (SSP), the computer is more than just a tool for simulating the mind. It is part of the very subject matter of the field. Why? Because computer systems, robots, and people are all examples of symbolic systems, agents that use meaningful symbols to represent the world around them so as to communicate and generally act in the world. The notions of symbol, meaning, representation, information, and action are at the heart of the study of symbolic systems. This common core of notions arises in a variety of fields including artificial intelligence, computer science, cognitive psychology, linguistics, philosophy, and symbolic logic.
