

Regular Expressions

Recap from Last Time

Regular Languages

- A language L is a ***regular language*** if there is a DFA D such that $\mathcal{L}(D) = L$.
- ***Theorem:*** The following are equivalent:
 - L is a regular language.
 - There is a DFA for L .
 - There is an NFA for L .

Language Concatenation

- If $w \in \Sigma^*$ and $x \in \Sigma^*$, then wx is the **concatenation** of w and x .
- If L_1 and L_2 are languages over Σ , the **concatenation** of L_1 and L_2 is the language L_1L_2 defined as

$$L_1L_2 = \{ wx \mid w \in L_1 \text{ and } x \in L_2 \}$$

- Example: if $L_1 = \{ a, ba, bb \}$ and $L_2 = \{ aa, bb \}$, then

$$L_1L_2 = \{ aaa, abb, baaa, babb, bbaa, bbbb \}$$

Lots and Lots of Concatenation

- Consider the language $L = \{ \mathbf{aa}, \mathbf{b} \}$
- LL is the set of strings formed by concatenating pairs of strings in L .

$\{ \mathbf{aaaa}, \mathbf{aab}, \mathbf{baa}, \mathbf{bb} \}$

- LLL is the set of strings formed by concatenating triples of strings in L .

$\{ \mathbf{aaaaaa}, \mathbf{aaaab}, \mathbf{aabaa}, \mathbf{aabb}, \mathbf{baaaa}, \mathbf{baab}, \mathbf{bbaa}, \mathbf{bbb} \}$

- $LLLL$ is the set of strings formed by concatenating quadruples of strings in L .

$\{ \mathbf{aaaaaaaa}, \mathbf{aaaaaab}, \mathbf{aaaabaa}, \mathbf{aaaabb}, \mathbf{aabaaaa}, \mathbf{aabaab}, \mathbf{aabbaa}, \mathbf{aabbb}, \mathbf{baaaaaa}, \mathbf{baaaab}, \mathbf{baabaa}, \mathbf{baabb}, \mathbf{bbaaaa}, \mathbf{bbaab}, \mathbf{bbbaa}, \mathbf{bbbb} \}$

Language Exponentiation

- We can define what it means to “exponentiate” a language as follows:
- $L^0 = \{\varepsilon\}$
 - Intuition: The only string you can form by gluing no strings together is the empty string.
 - Notice that $\{\varepsilon\} \neq \emptyset$. Can you explain why?
- $L^{n+1} = LL^n$
 - Idea: Concatenating $(n+1)$ strings together works by concatenating n strings, then concatenating one more.
- **Question to ponder:** Why define $L^0 = \{\varepsilon\}$?
- **Question to ponder:** What is \emptyset^0 ?

The Kleene Closure

- An important operation on languages is the ***Kleene Closure***, which is defined as

$$L^* = \{ w \in \Sigma^* \mid \exists n \in \mathbb{N}. w \in L^n \}$$

- Mathematically:

$$w \in L^* \quad \text{iff} \quad \exists n \in \mathbb{N}. w \in L^n$$

- Intuitively, all possible ways of concatenating zero or more strings in L together, possibly with repetition.
- ***Question:*** What is \emptyset^0 ?

The Kleene Closure

If $L = \{ \mathbf{a}, \mathbf{bb} \}$, then $L^* = \{$

$\epsilon,$

$\mathbf{a}, \mathbf{bb},$

$\mathbf{aa}, \mathbf{abb}, \mathbf{bba}, \mathbf{bbbb},$

$\mathbf{aaa}, \mathbf{aabb}, \mathbf{abba}, \mathbf{abbbb}, \mathbf{bbaa}, \mathbf{bbabb}, \mathbf{bbbba}, \mathbf{bbbbbb},$

\dots

$\}$

Think of L^* as the set of strings you can make if you have a collection of stamps - one for each string in L - and you form every possible string that can be made from those stamps.

Closure Properties

- ***Theorem:*** If L_1 and L_2 are regular languages over an alphabet Σ , then so are the following languages:
 - \bar{L}_1
 - $L_1 \cup L_2$
 - $L_1 \cap L_2$
 - L_1L_2
 - L_1^*
- These properties are called ***closure properties of the regular languages.***

New Stuff!

Another View of Regular Languages

Rethinking Regular Languages

- We currently have several tools for showing a language L is regular:
 - Construct a DFA for L .
 - Construct an NFA for L .
 - Combine several simpler regular languages together via closure properties to form L .
- We have not spoken much of this last idea.

Constructing Regular Languages

- **Idea:** Build up all regular languages as follows:
 - Start with a small set of simple languages we already know to be regular.
 - Using closure properties, combine these simple languages together to form more elaborate languages.
- *This is a bottom-up approach to the regular languages.*

Constructing Regular Languages

- **Idea:** Build up all regular languages as follows:
 - Start with a small set of simple languages we already know
 - Using closure operations (union, concatenation, Kleene star) to elaborate on these
- *This is a regular language*

Regular Expressions

- ***Regular expressions*** are a way of describing a language via a string representation.
- They're used just about everywhere:
 - They're built into the JavaScript language and used for data validation.
 - They're used in the UNIX grep and flex tools to search files and build compilers.
 - They're employed to clean and scrape data for large-scale analysis projects.
- Conceptually, regular expressions are strings describing how to assemble a larger language out of smaller pieces.

Atomic Regular Expressions

- The regular expressions begin with three simple building blocks.
- The symbol \emptyset is a regular expression that represents the empty language \emptyset .
- For any $a \in \Sigma$, the symbol a is a regular expression for the language $\{a\}$.
- The symbol ϵ is a regular expression that represents the language $\{\epsilon\}$.
 - **Remember:** $\{\epsilon\} \neq \emptyset!$
 - **Remember:** $\{\epsilon\} \neq \epsilon!$

Compound Regular Expressions

- If R_1 and R_2 are regular expressions, R_1R_2 is a regular expression for the *concatenation* of the languages of R_1 and R_2 .
- If R_1 and R_2 are regular expressions, $R_1 \cup R_2$ is a regular expression for the *union* of the languages of R_1 and R_2 .
- If R is a regular expression, R^* is a regular expression for the *Kleene closure* of the language of R .
- If R is a regular expression, (R) is a regular expression with the same meaning as R .

Operator Precedence

- Here's the operator precedence for regular expressions:

(R)

R^*

R_1R_2

$R_1 \cup R_2$

- So **ab*cUd** is parsed as **((a(b*))c)Ud**

Regular Expressions, Formally

- The **language of a regular expression** is the language described by that regular expression.
- Formally:
 - $\mathcal{L}(\epsilon) = \{\epsilon\}$
 - $\mathcal{L}(\emptyset) = \emptyset$
 - $\mathcal{L}(a) = \{a\}$
 - $\mathcal{L}(R_1R_2) = \mathcal{L}(R_1) \mathcal{L}(R_2)$
 - $\mathcal{L}(R_1 \cup R_2) = \mathcal{L}(R_1) \cup \mathcal{L}(R_2)$
 - $\mathcal{L}(R^*) = \mathcal{L}(R)^*$
 - $\mathcal{L}((R)) = \mathcal{L}(R)$

Worthwhile activity: Apply this recursive definition to

$a(b \cup c)((d))$

and see what you get.

Designing Regular Expressions

- Let $\Sigma = \{a, b\}$.
- Let $L = \{ w \in \Sigma^* \mid w \text{ contains } aa \text{ as a substring} \}$.

Designing Regular Expressions

- Let $\Sigma = \{a, b\}$.
- Let $L = \{ w \in \Sigma^* \mid w \text{ contains } aa \text{ as a substring} \}$.

Shorthand Summary

- R^n is shorthand for $RR \dots R$ (n times).
 - Edge case: define $R^0 = \epsilon$.
- Σ is shorthand for “any character in Σ .”
- $R?$ is shorthand for $(R \cup \epsilon)$, meaning “zero or one copies of R .”
- R^+ is shorthand for RR^* , meaning “one or more copies of R .”

Let's take a quick break!

Time-Out for Announcements!

Midterm Graded

- We have finished grading the midterm exam. Grades and feedback are now available on Gradescope.

80th Percentile: 39 / 40 (97.5%)

60th Percentile: 37 / 40 (92.5%)

40th Percentile: 35 / 40 (87.5%)

20th Percentile: 29 / 49 (72.5%)

- If you'd like to meet with us 1:1 to discuss the exam, or your general progress in the course, just reach out and we'll make it happen.
- Did we make a mistake? Regrades on Gradescope are open and are due in one week.

Problem Set Five

- Problem Set Four was due at 4:00PM on Sunday.
- Problem Set Five is currently out. It's due this Friday at 4:00PM.
 - Design DFAs and NFAs for a range of problems!
 - Explore formal language theory!
 - See some clever applications!

The Power of Regular Expressions

Theorem: If R is a regular expression, then $\mathcal{L}(R)$ is regular.

Proof idea: Use induction!

- The atomic regular expressions all represent regular languages.
- The combination steps represent closure properties.
- So anything you can make from them must be regular!

Thompson's Algorithm

- In practice, many regex matchers use an algorithm called ***Thompson's algorithm*** to convert regular expressions into NFAs (and, from there, to DFAs).
 - Read Sipser if you're curious!
- ***Fun fact:*** the “Thompson” here is Ken Thompson, one of the co-inventors of Unix!

From NFAs to Regular Expressions

From NFAs to Regular Expressions

The State-Elimination Algorithm

- Start with an NFA N for the language L .
- Add a new start state q_s and accept state q_f to the NFA.
 - Add an ε -transition from q_s to the old start state of N .
 - Add ε -transitions from each accepting state of N to q_f , then mark them as not accepting.
- Repeatedly remove states other than q_s and q_f from the NFA by “shortcutting” them until only two states remain: q_s and q_f .
- The transition from q_s to q_f is then a regular expression for the NFA.

The State-Elimination Algorithm

- To eliminate a state q from the automaton, do the following for each pair of states q_0 and q_1 , where there's a transition from q_0 into q and a transition from q into q_1 :
 - Let R_{in} be the regex on the transition from q_0 to q .
 - Let R_{out} be the regex on the transition from q to q_1 .
 - If there is a regular expression R_{stay} on a transition from q to itself, add a new transition from q_0 to q_1 labeled $((R_{in})(R_{stay})^*(R_{out}))$.
 - If there isn't, add a new transition from q_0 to q_1 labeled $((R_{in})(R_{out}))$
- If a pair of states has multiple transitions between them labeled R_1, R_2, \dots, R_k , replace them with a single transition labeled $R_1 \cup R_2 \cup \dots \cup R_k$.

Our Transformations

Theorem: The following are all equivalent:

- L is a regular language.
- There is a DFA D such that $\mathcal{L}(D) = L$.
- There is an NFA N such that $\mathcal{L}(N) = L$.
- There is a regular expression R such that $\mathcal{L}(R) = L$.

Why This Matters

- The equivalence of regular expressions and finite automata has practical relevance.
 - Regular expression matchers have all the power available to them of DFAs and NFAs.
- This also is hugely theoretically significant: the regular languages can be assembled “from scratch” using a small number of operations!

Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

For simplicity, let's just use a single character for the "cream" part of the Oreo :)

Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design a DFA for the language

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design a DFA for the language

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

$$\mathbf{ORO} \in L$$

$$\mathbf{OR} \notin L$$

$$\mathbf{ROOOR} \in L$$

$$\mathbf{OOOOR} \notin L$$

$$\mathbf{ORORORRO} \in L$$

$$\mathbf{RORORORO} \notin L$$

Designing DFAs

- **States** – pieces of information
 - What do I have to keep track of in the course of figuring out whether a string is in this language?
- **Transitions** – updating state
 - From the state I'm currently in, what do I know about my string? How would reading this character change what I know?

An Analogy

Imagine a scenario where Bob is thinking of a string and Alice has to figure out whether that string is in a particular language

$L = \{ w \text{ is divisible by } 5 \}$

Alice

Bob

An Analogy

The catch: Bob can only send Alice one character at a time, and Alice doesn't know how long the string is until Bob tells her that he's done sending input

$L = \{ w \text{ is divisible by } 5 \}$

Alice

Bob

An Analogy

What does Alice need to remember about the characters she's receiving from Bob?

$L = \{ w \text{ is divisible by } 5 \}$

Alice

9

Bob

An Analogy

Key insight: Alice only needs to remember the last character she received from Bob

$L = \{ w \text{ is divisible by } 5 \}$

Alice

Bob

An Analogy

Key insight: Alice only needs to remember the last character she received from Bob

$L = \{ w \text{ is divisible by } 5 \}$

Alice

6

Bob

An Analogy

Key insight: Alice only needs to remember the last character she received from Bob

$L = \{ w \text{ is divisible by } 5 \}$

Alice

Bob

An Analogy

Key insight: Alice only needs to remember the last character she received from Bob

$L = \{ w \text{ is divisible by } 5 \}$

Alice

...

Bob

An Analogy

Eventually Bob gets to the end of his string and sends Alice a signal that he's done sending input

$L = \{ w \text{ is divisible by } 5 \}$

Alice

<end>

Bob

An Analogy

At this point, Alice just has to look at the last digit she wrote down and if it's a 5 or 0, Bob's string belongs in the language

$L = \{ w \text{ is divisible by } 5 \}$

Alice

<end>

Bob

DFA Design Strategy

1. Answer the question “What do I have to keep track of in the course of figuring out whether a string is in this language?”
2. Create a state that represents each possible answer to that question.
3. From each state, go through all of the characters and answer the question “How would reading this character change what I know about my string?” and draw transitions to the appropriate states.

Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design a DFA for the language

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

What do I have to keep track of in the course of figuring out whether a string is in this language?

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

- We need to keep track of the very first character
- And we need to keep track of the last character we've read so that when we reach the end, we can check whether the first and last characters were the same

Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design a DFA for the language

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

Remember that each state should represent a piece of information. We'll annotate what each state represents in blue.

Oreo Sandwiches

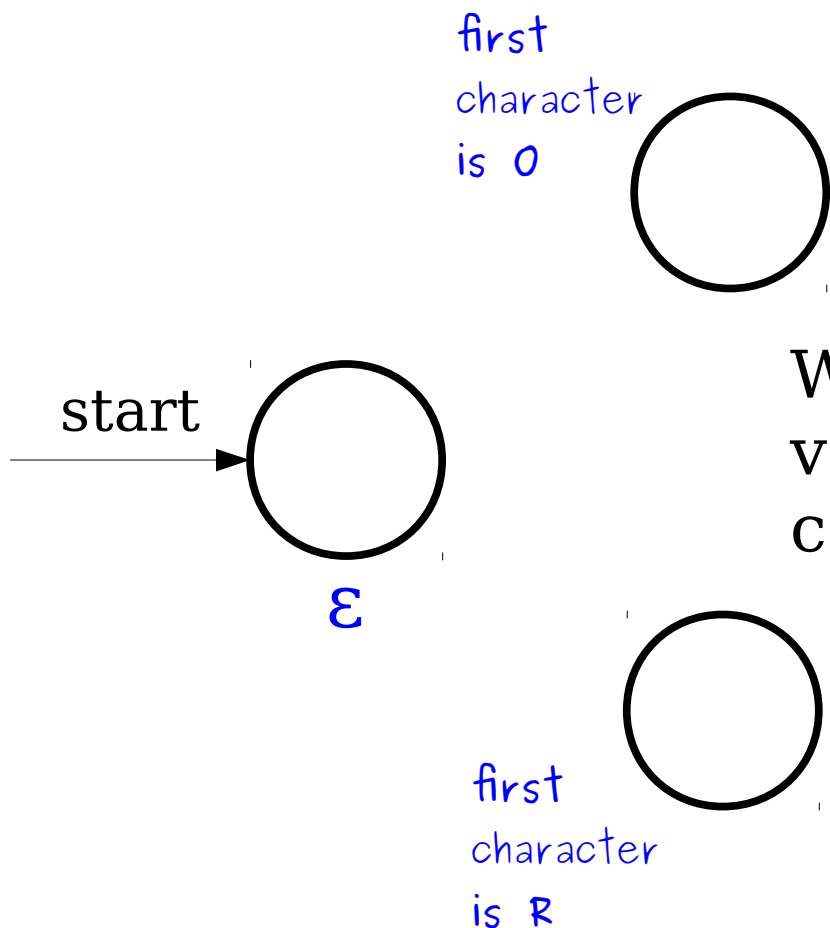

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

We need to keep track of the very first character, which could either be an **O** or an **R**

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

We need to keep track of the very first character, which could either be an **0** or an **R**

Oreo Sandwiches

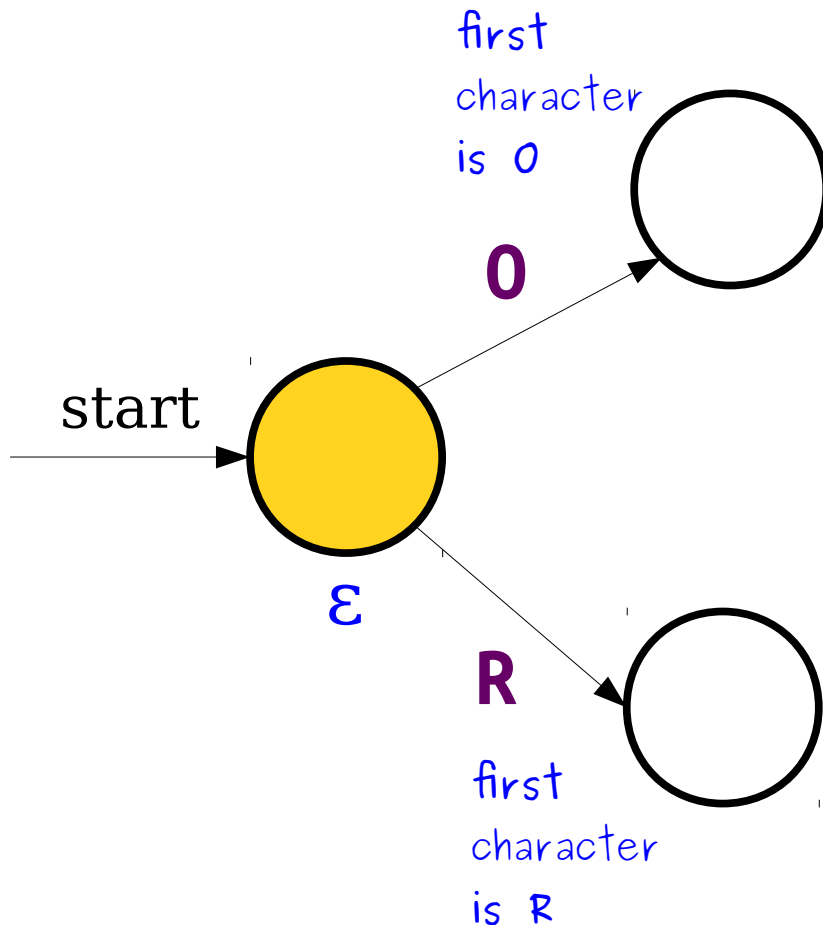

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

If I'm in the start state and I read an **0**, I should transition to this state

Oreo Sandwiches

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

Likewise if I'm in the start state and I read an **R**, I should transition to this state

Oreo Sandwiches

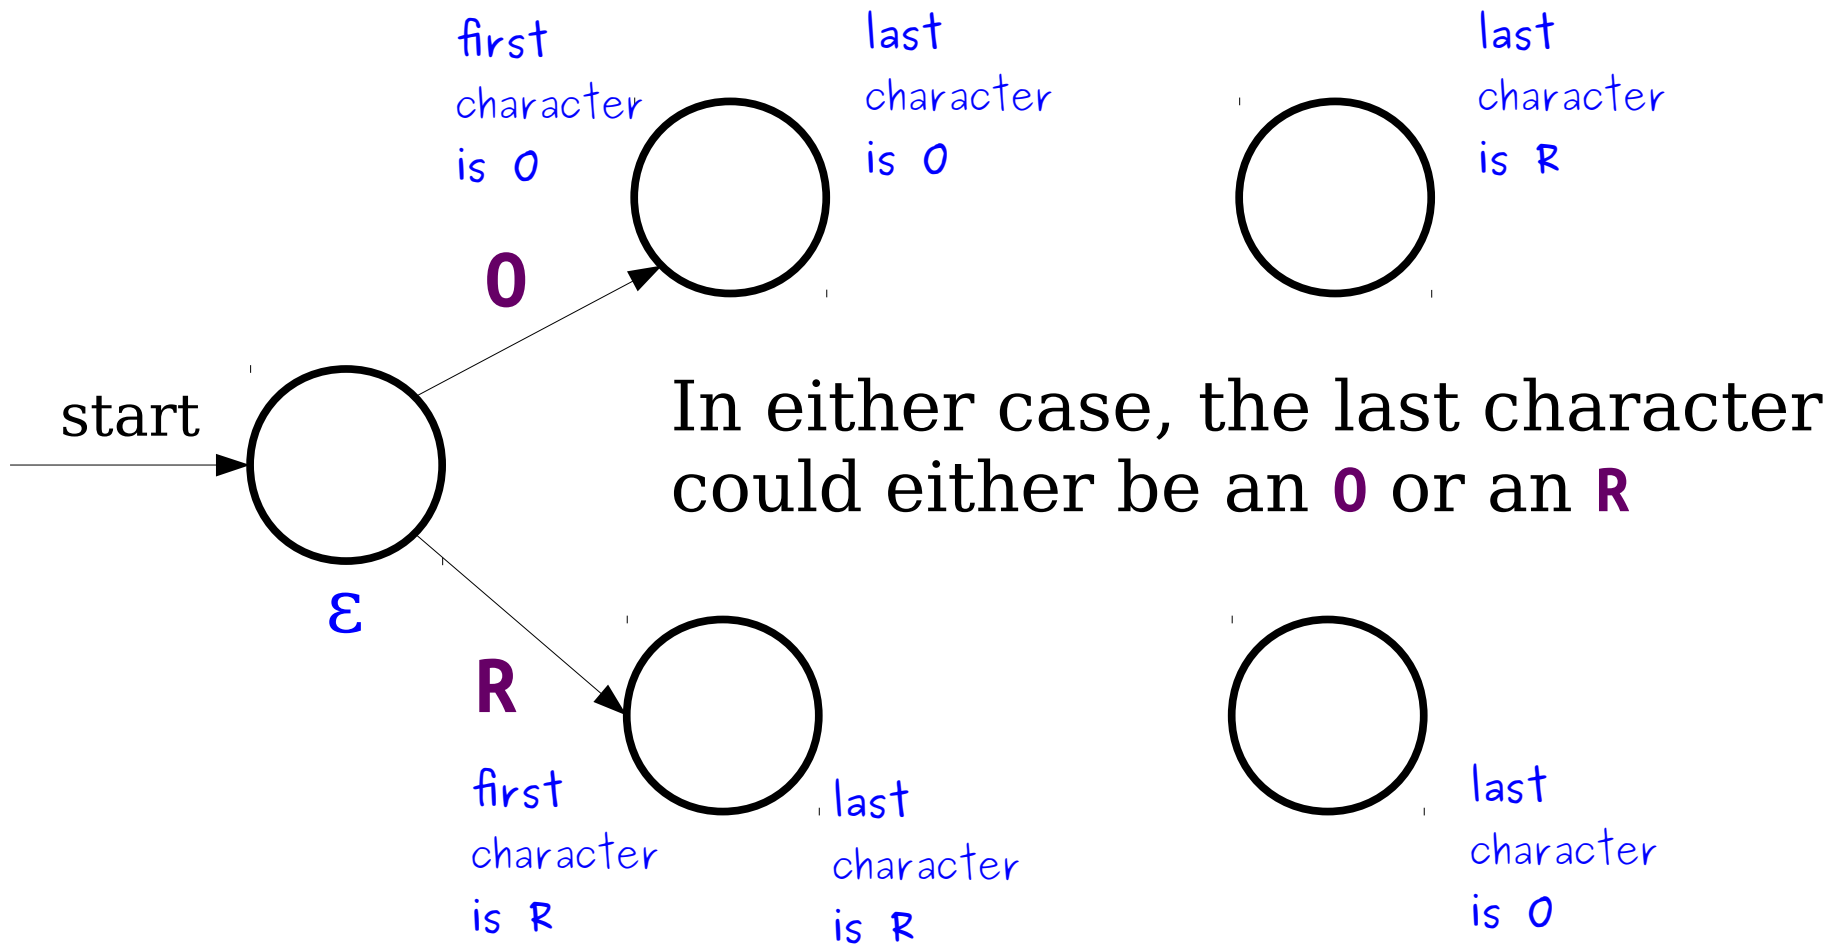

$$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$$

We also need to keep track of the last character we've read

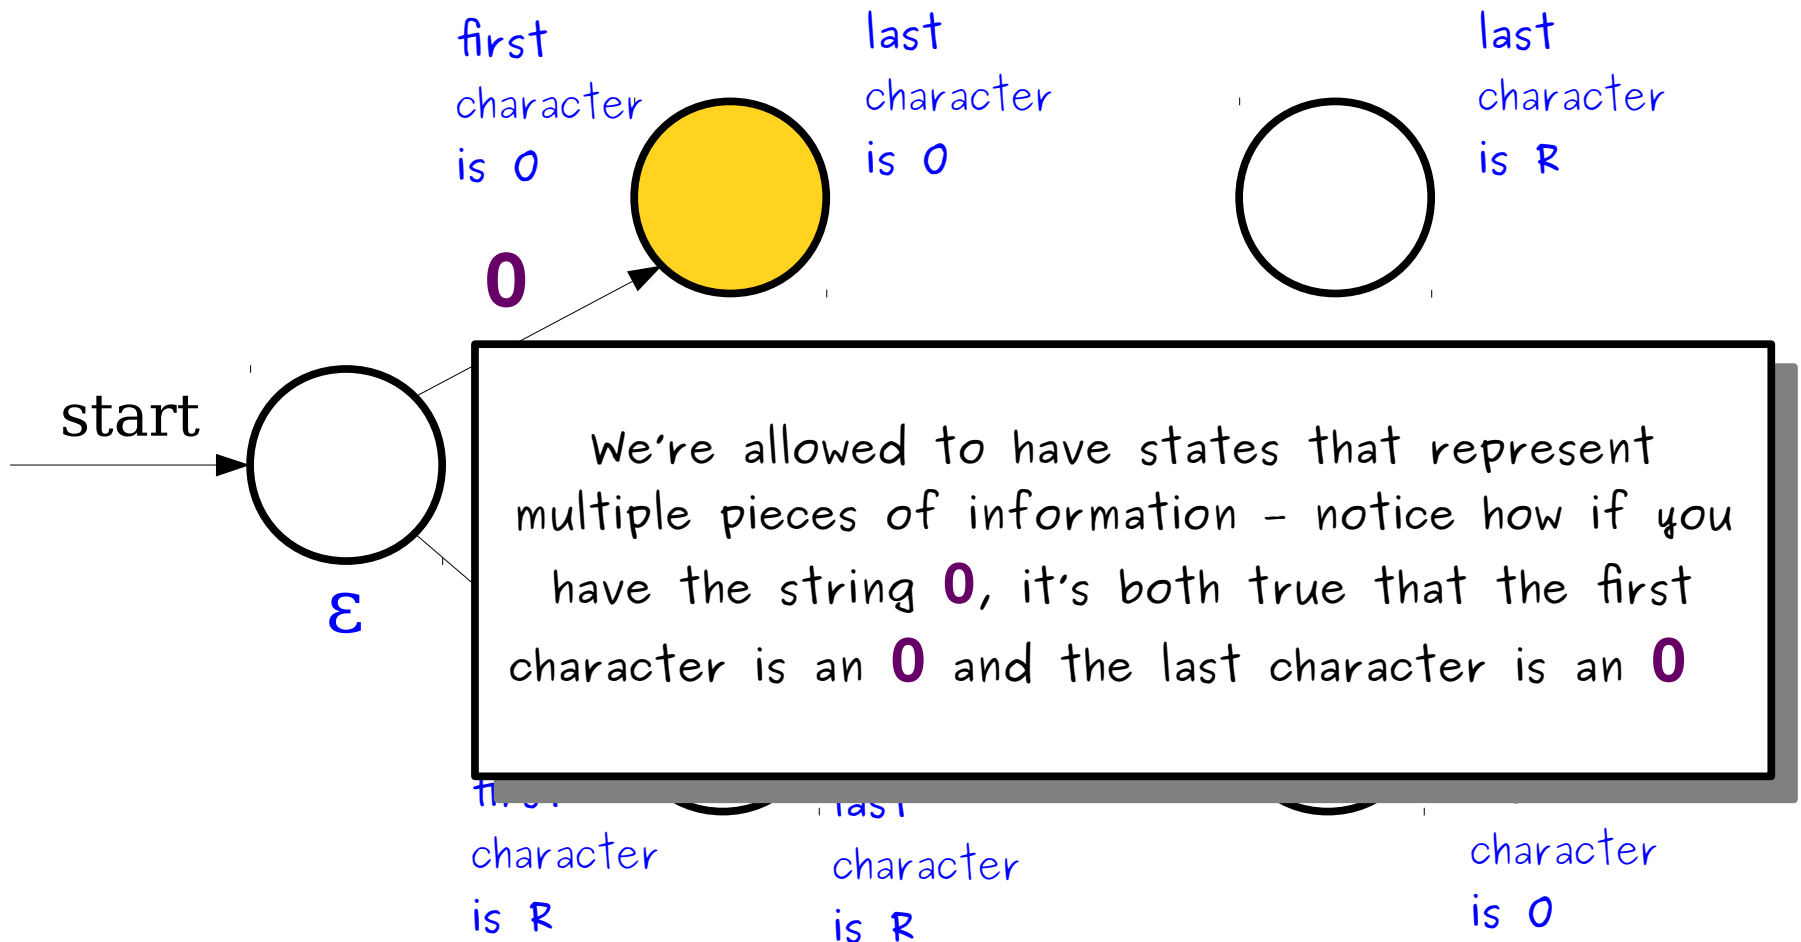

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

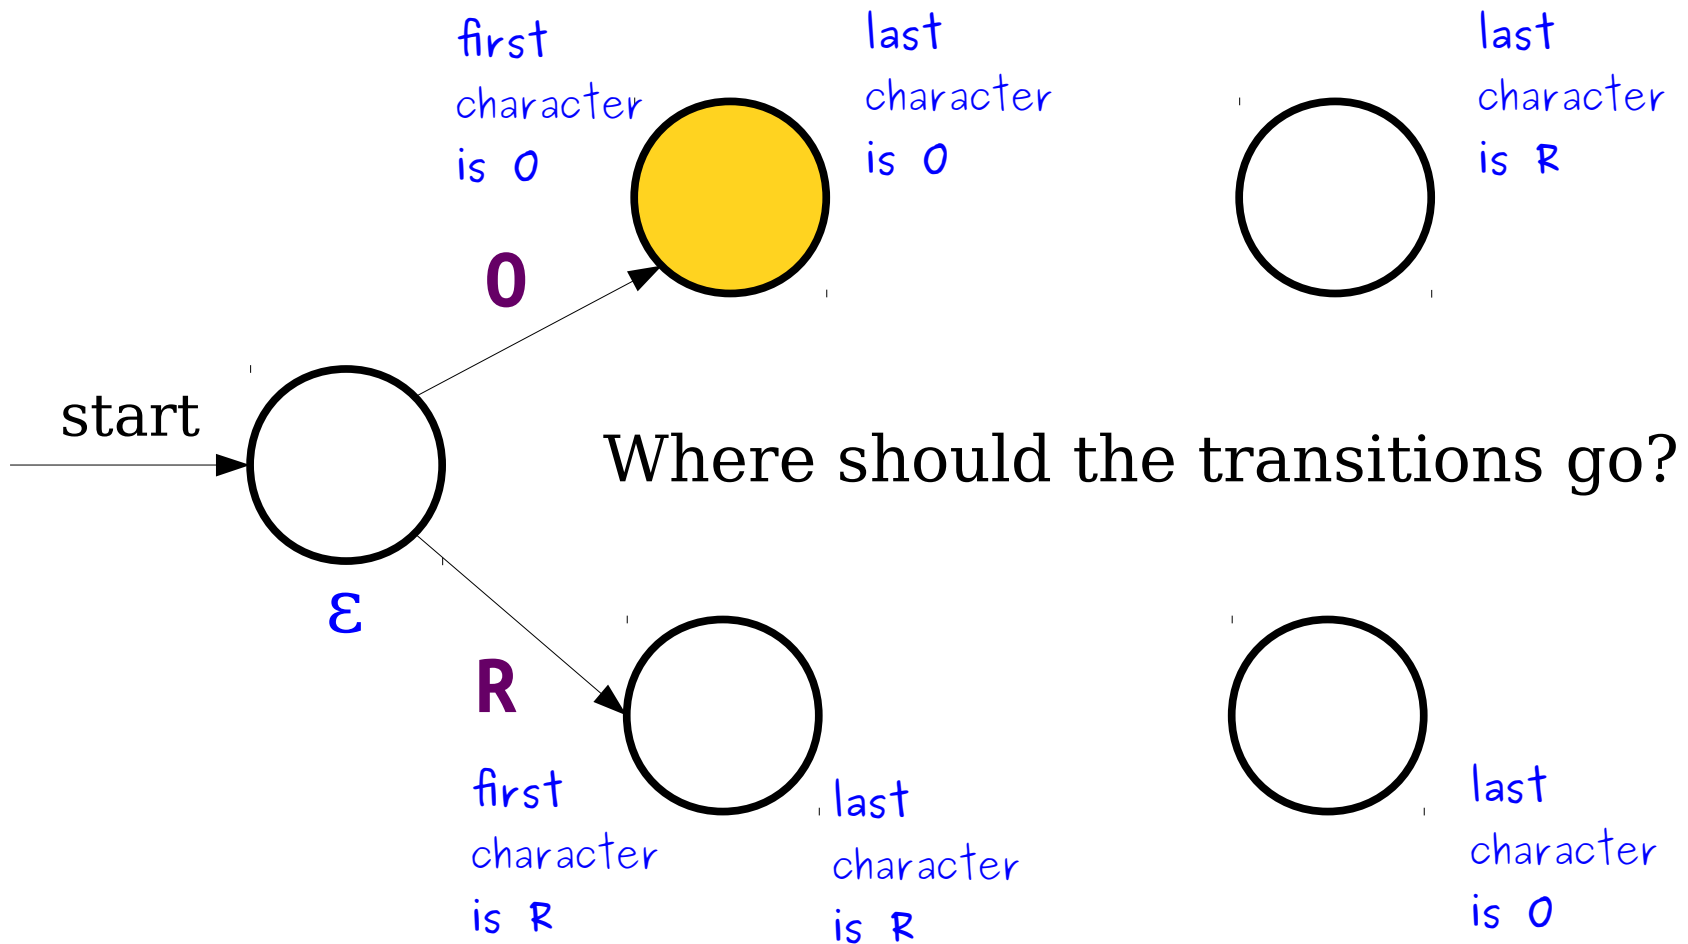

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

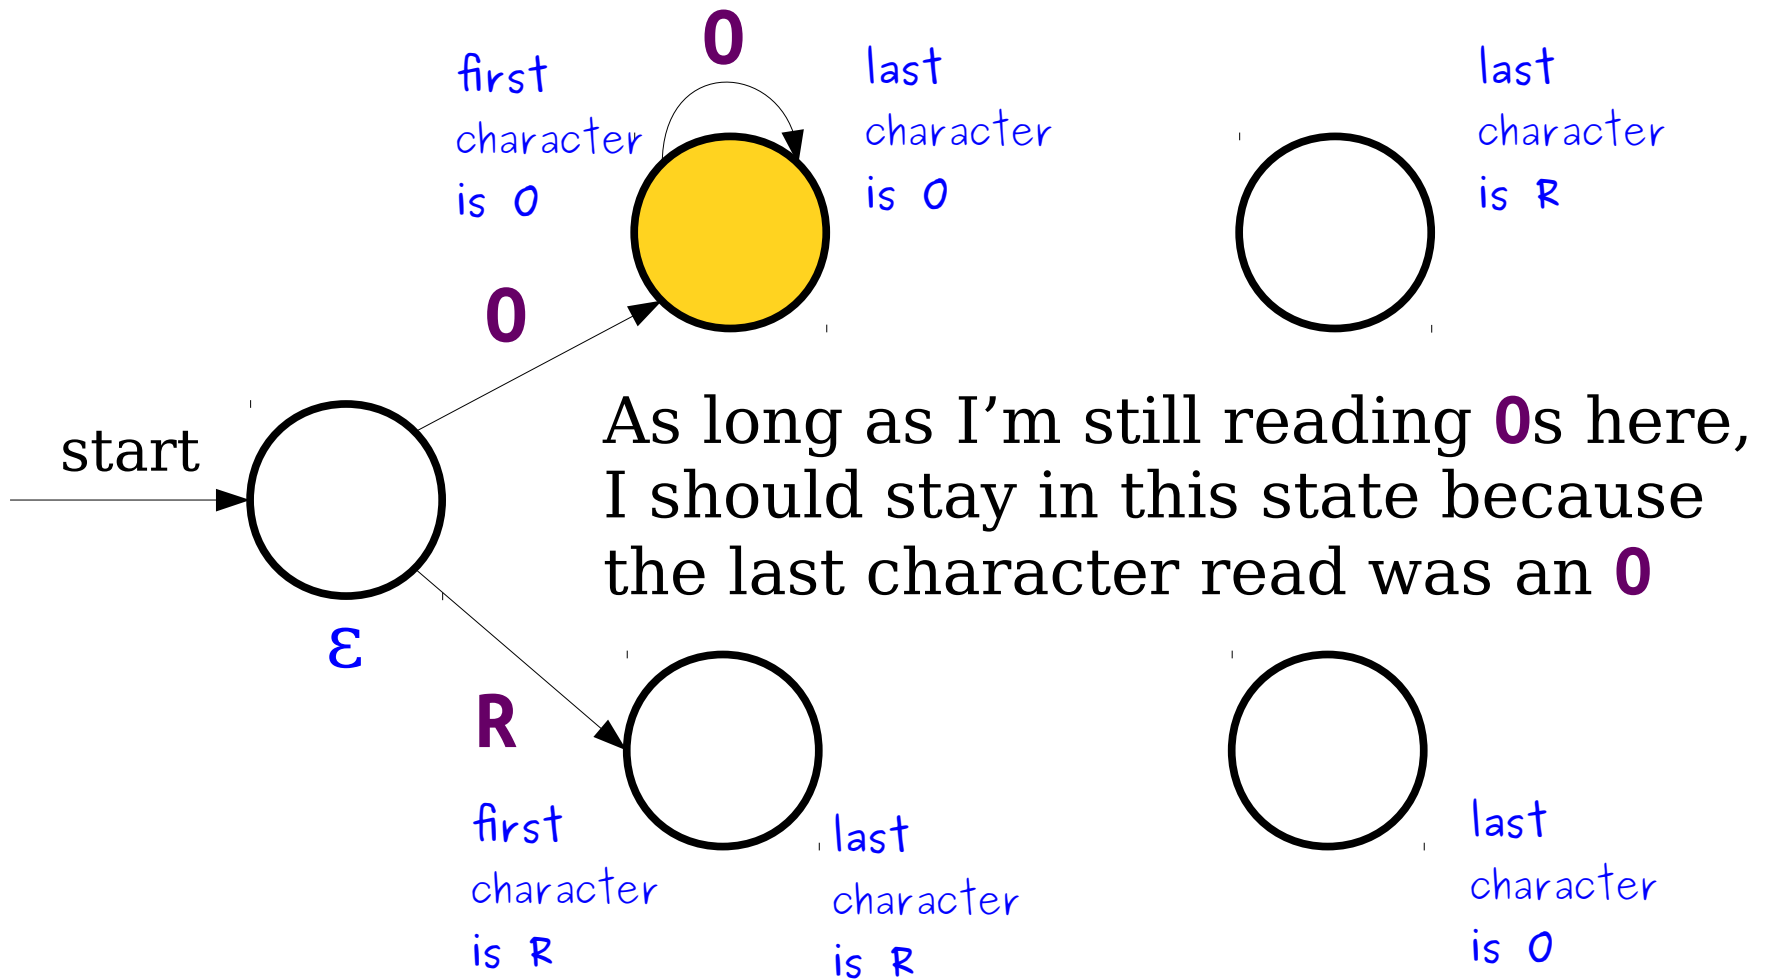

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

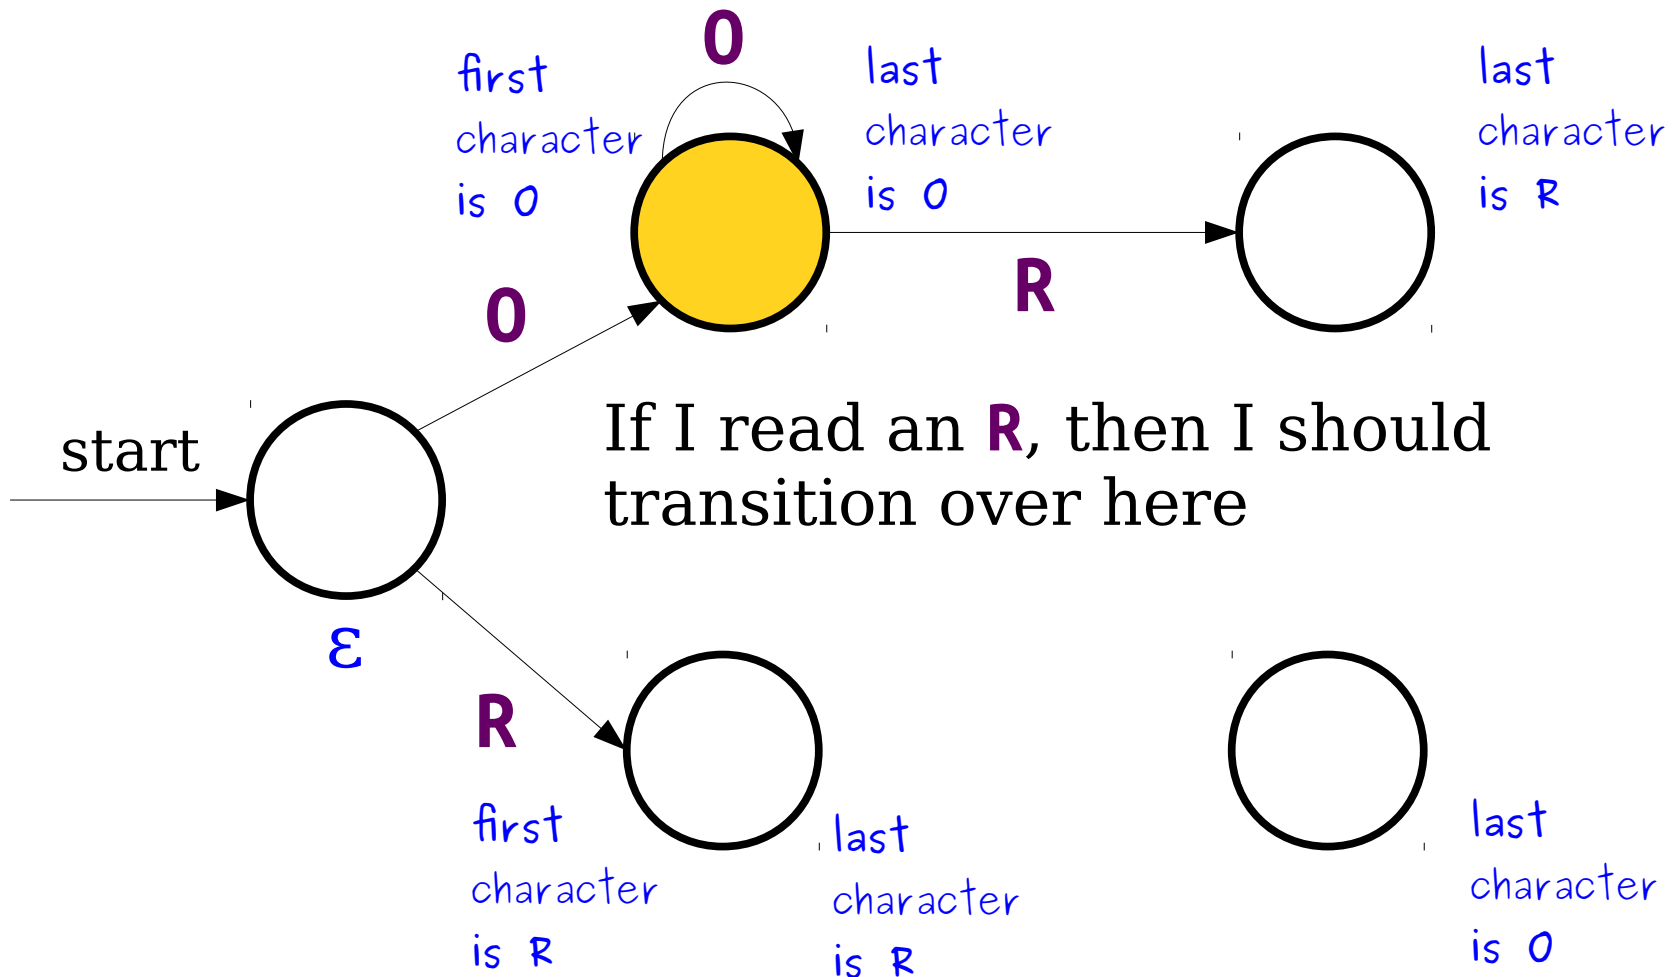

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

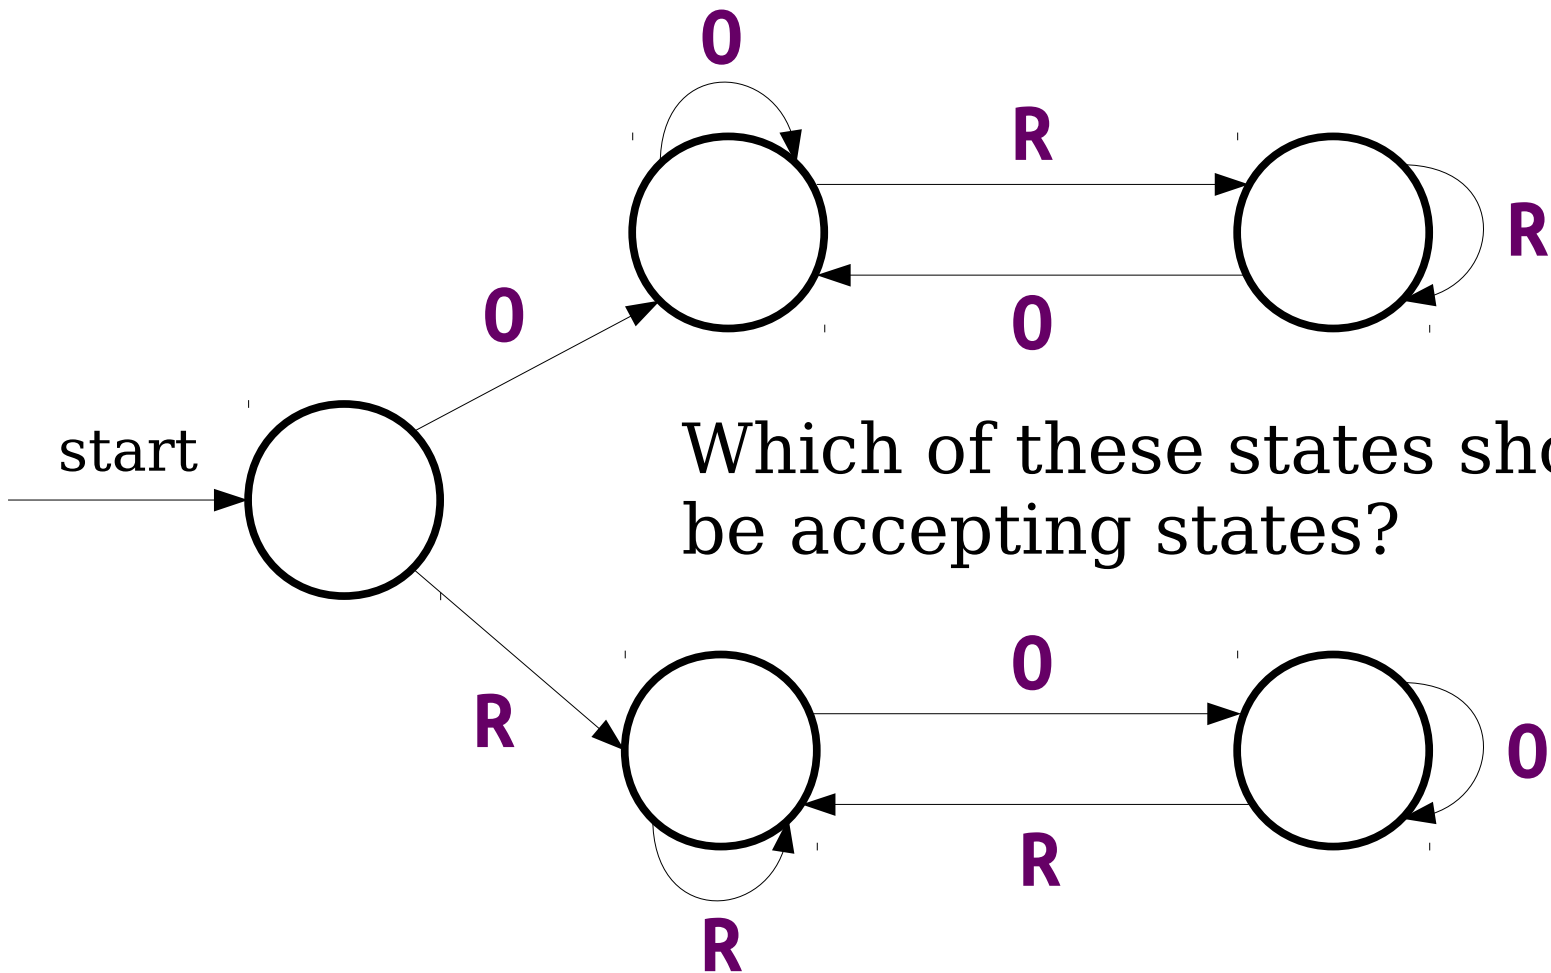

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

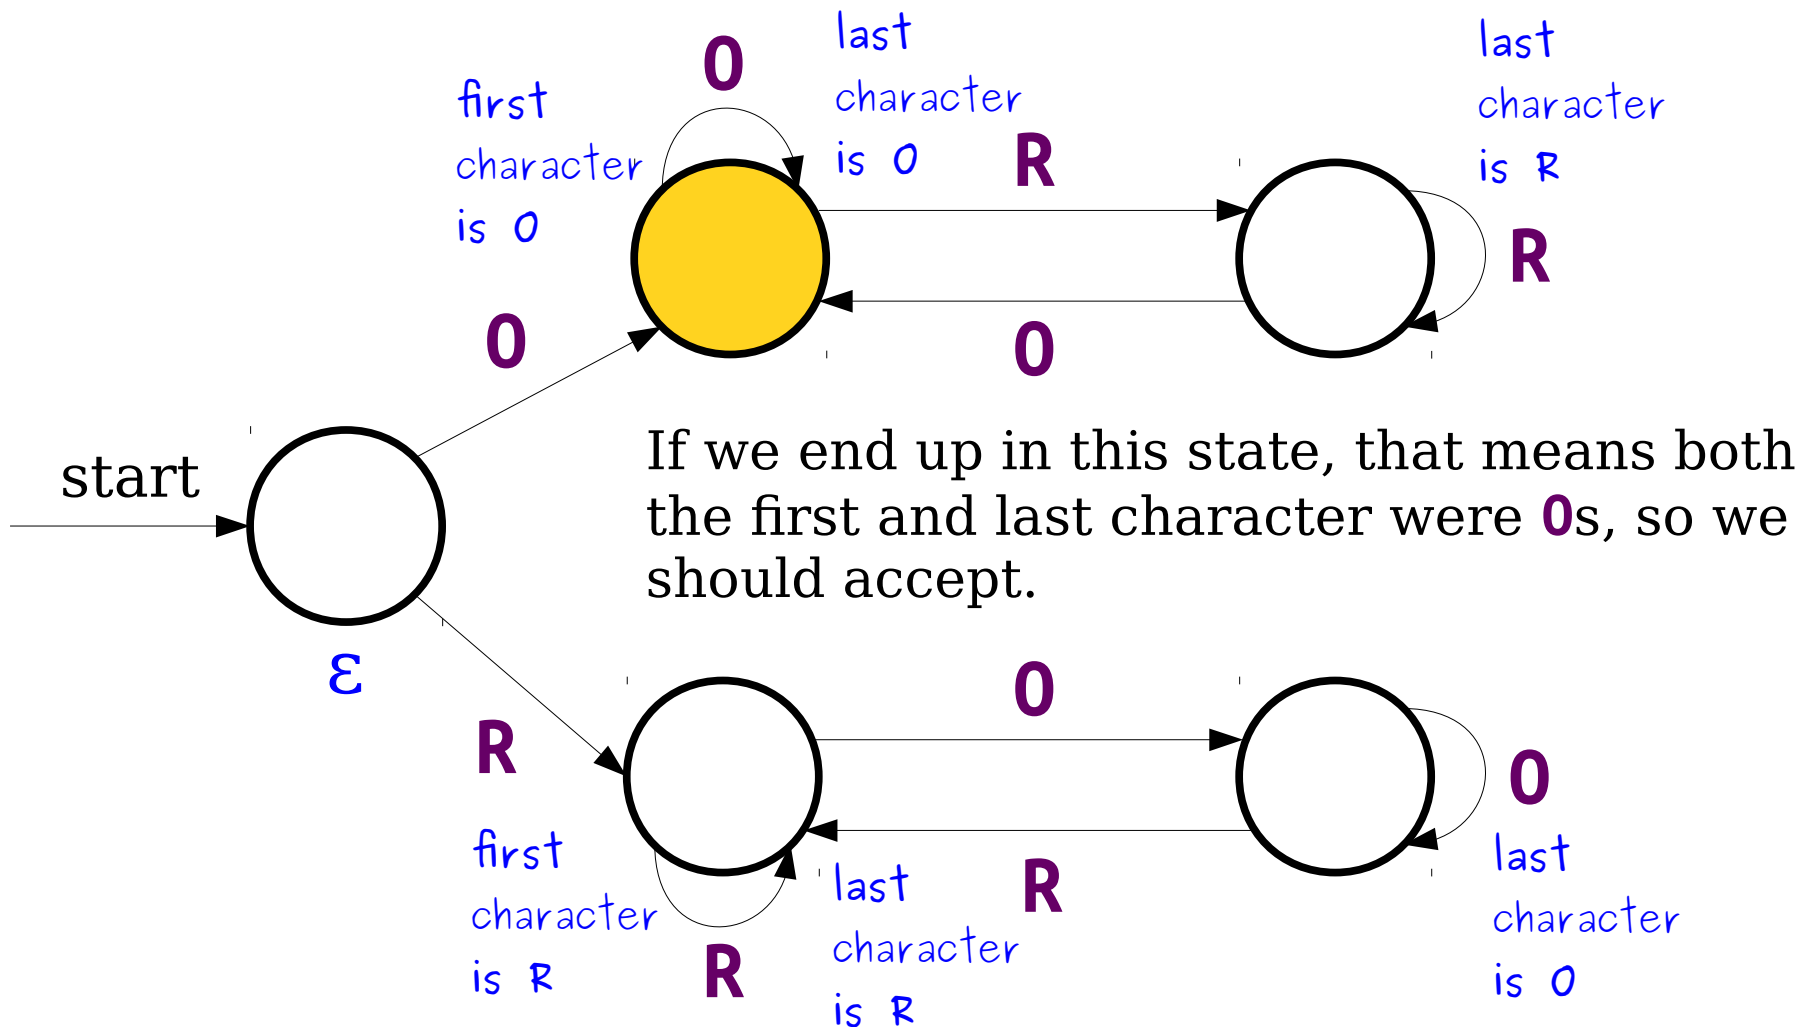

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

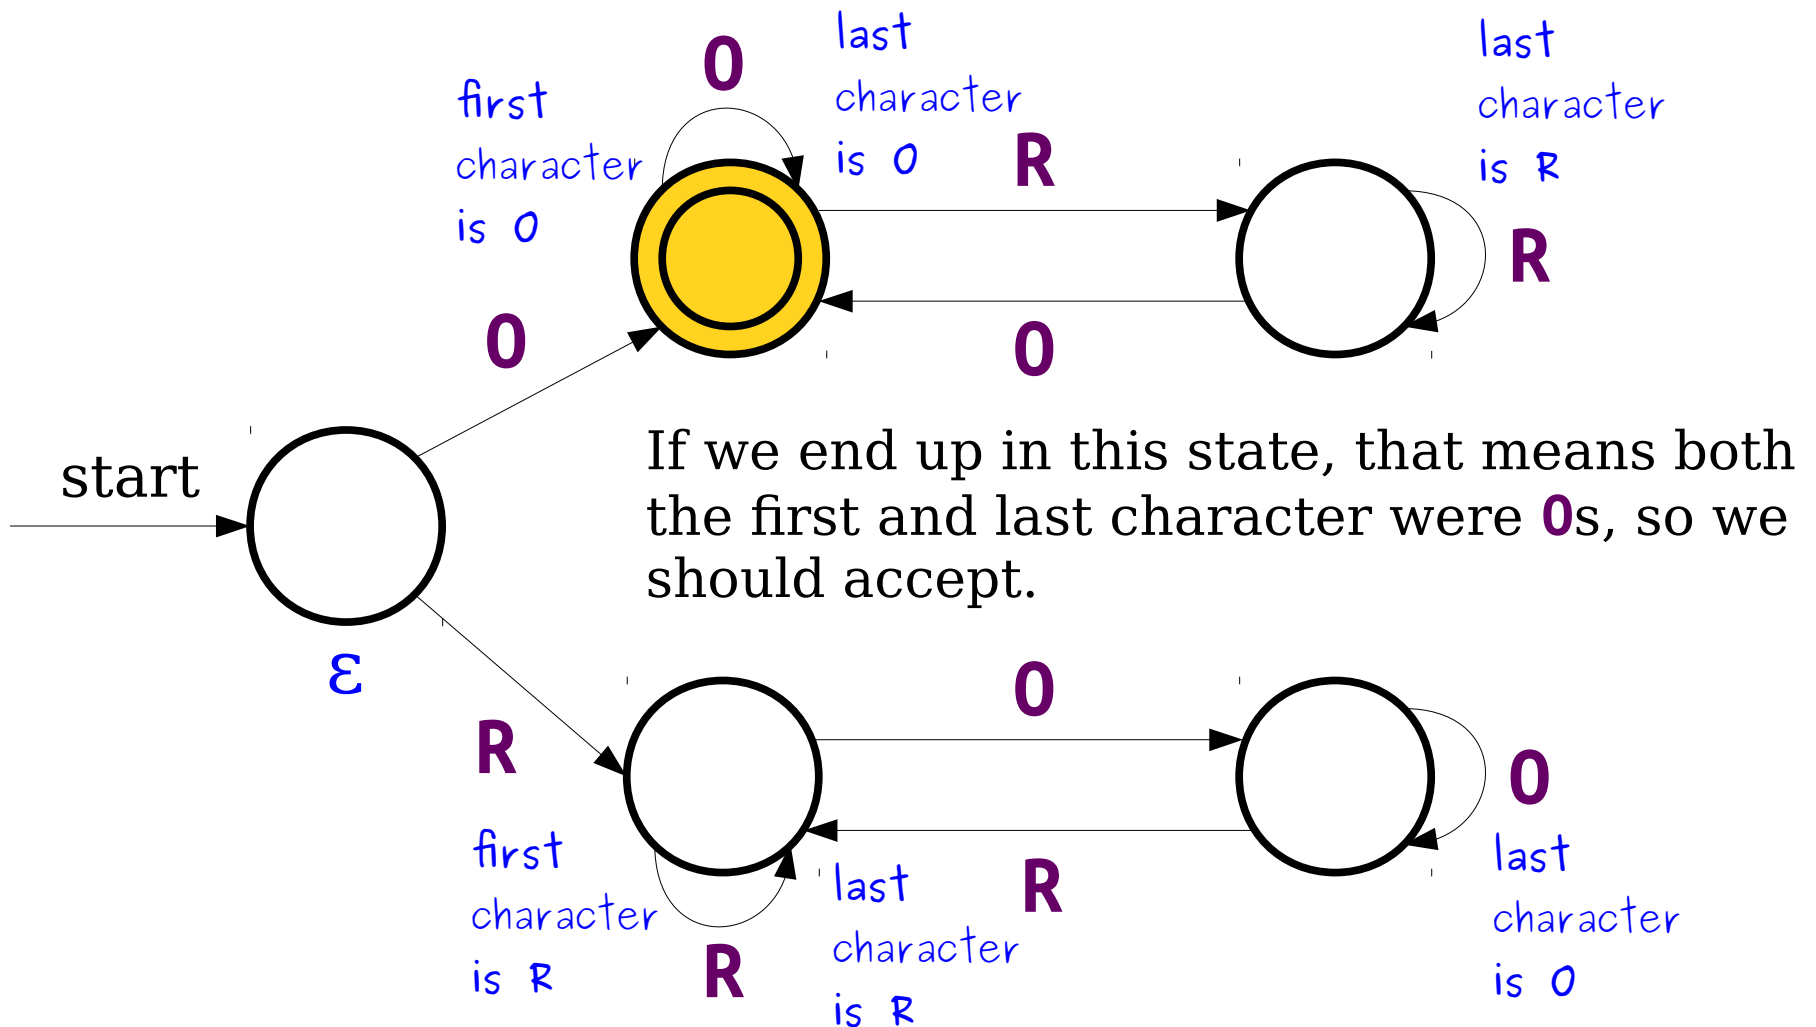

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

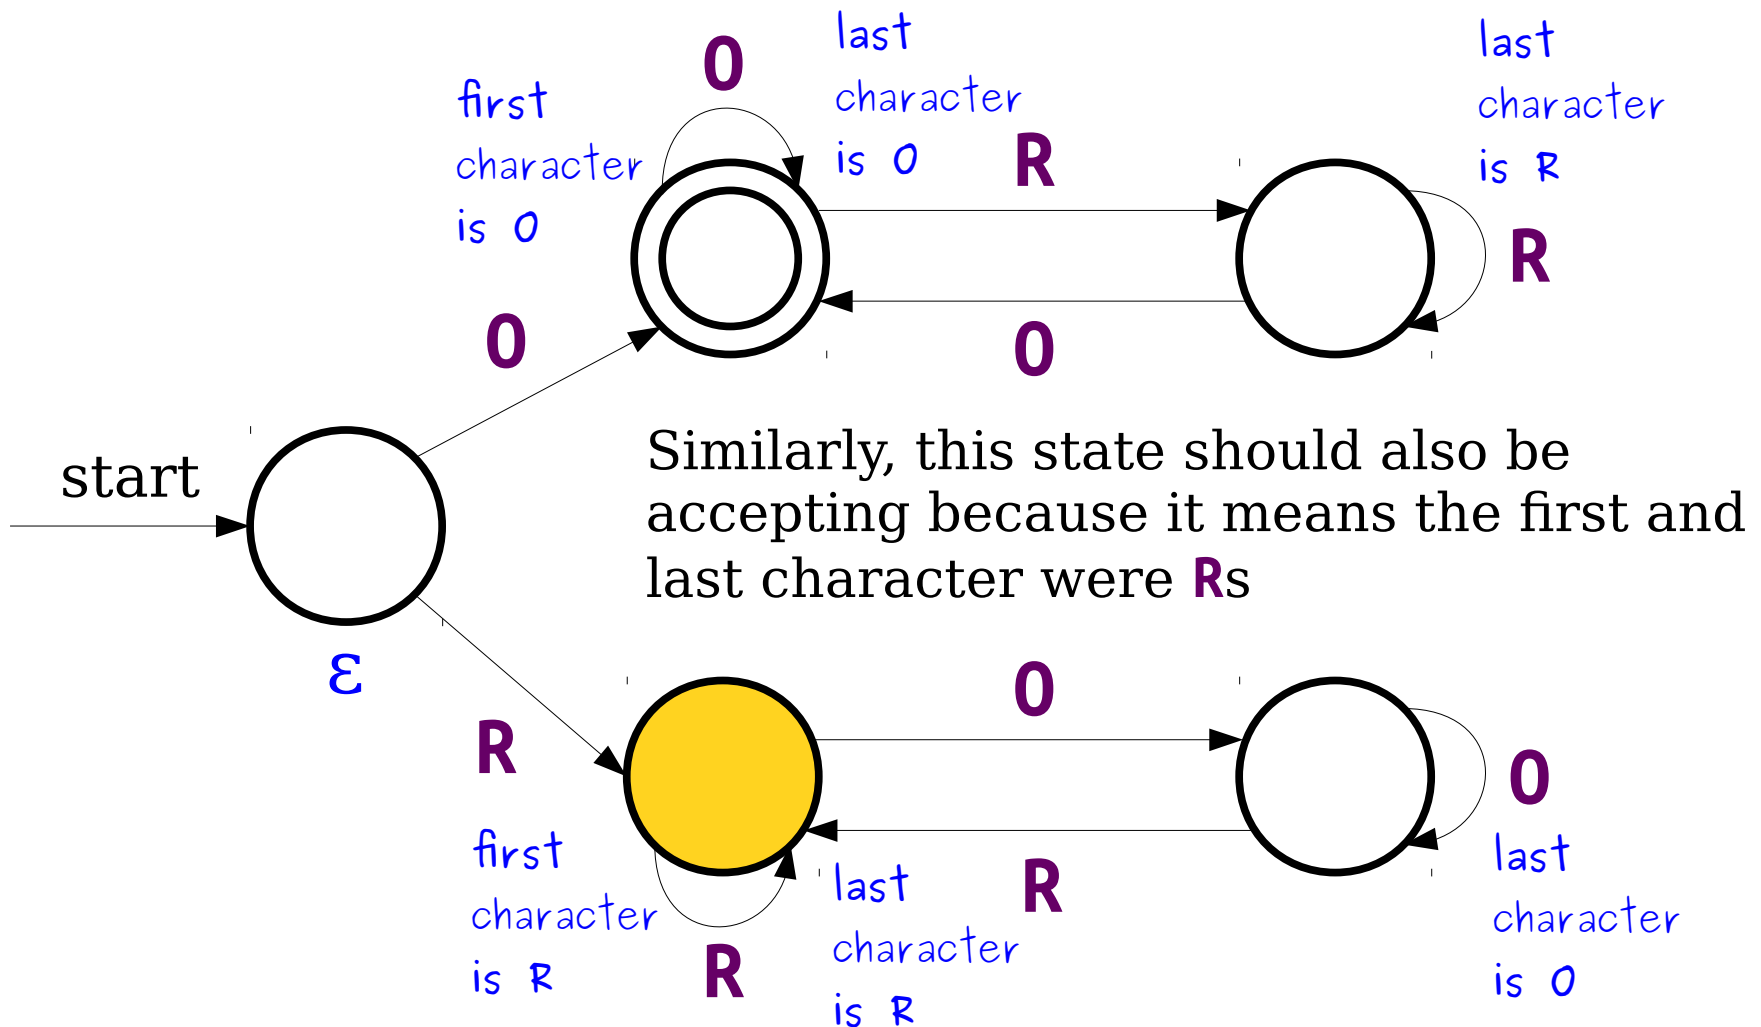

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

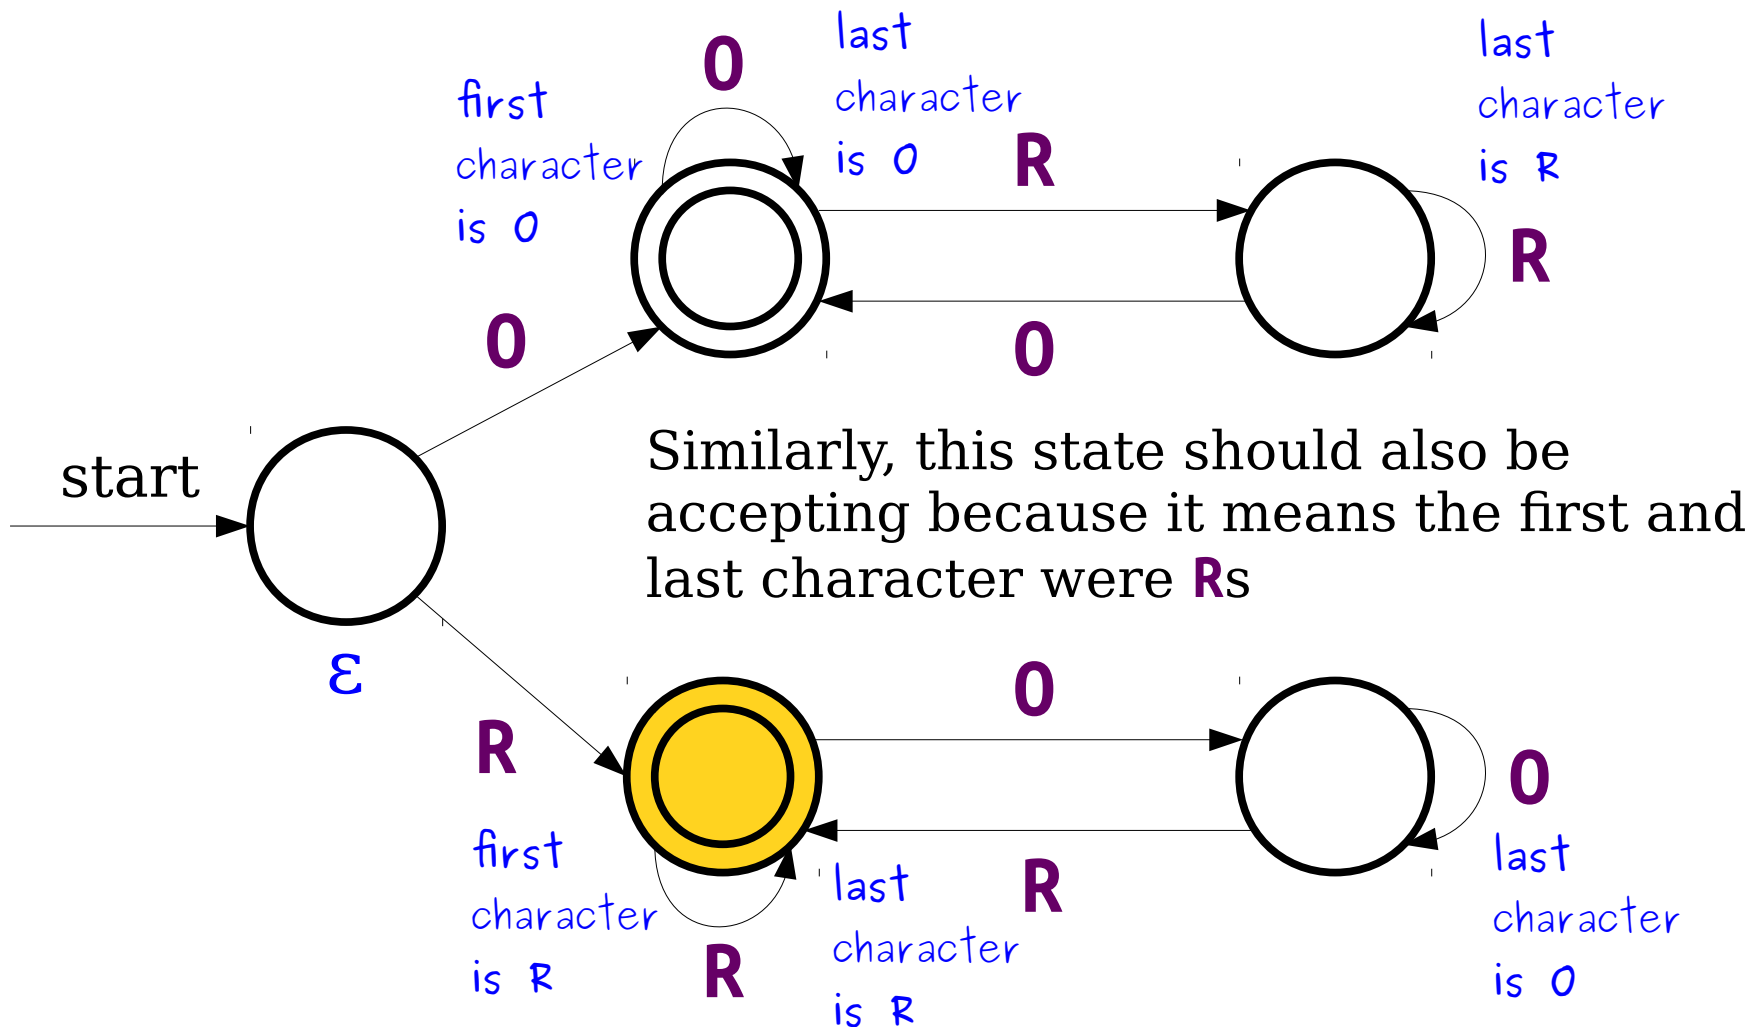

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

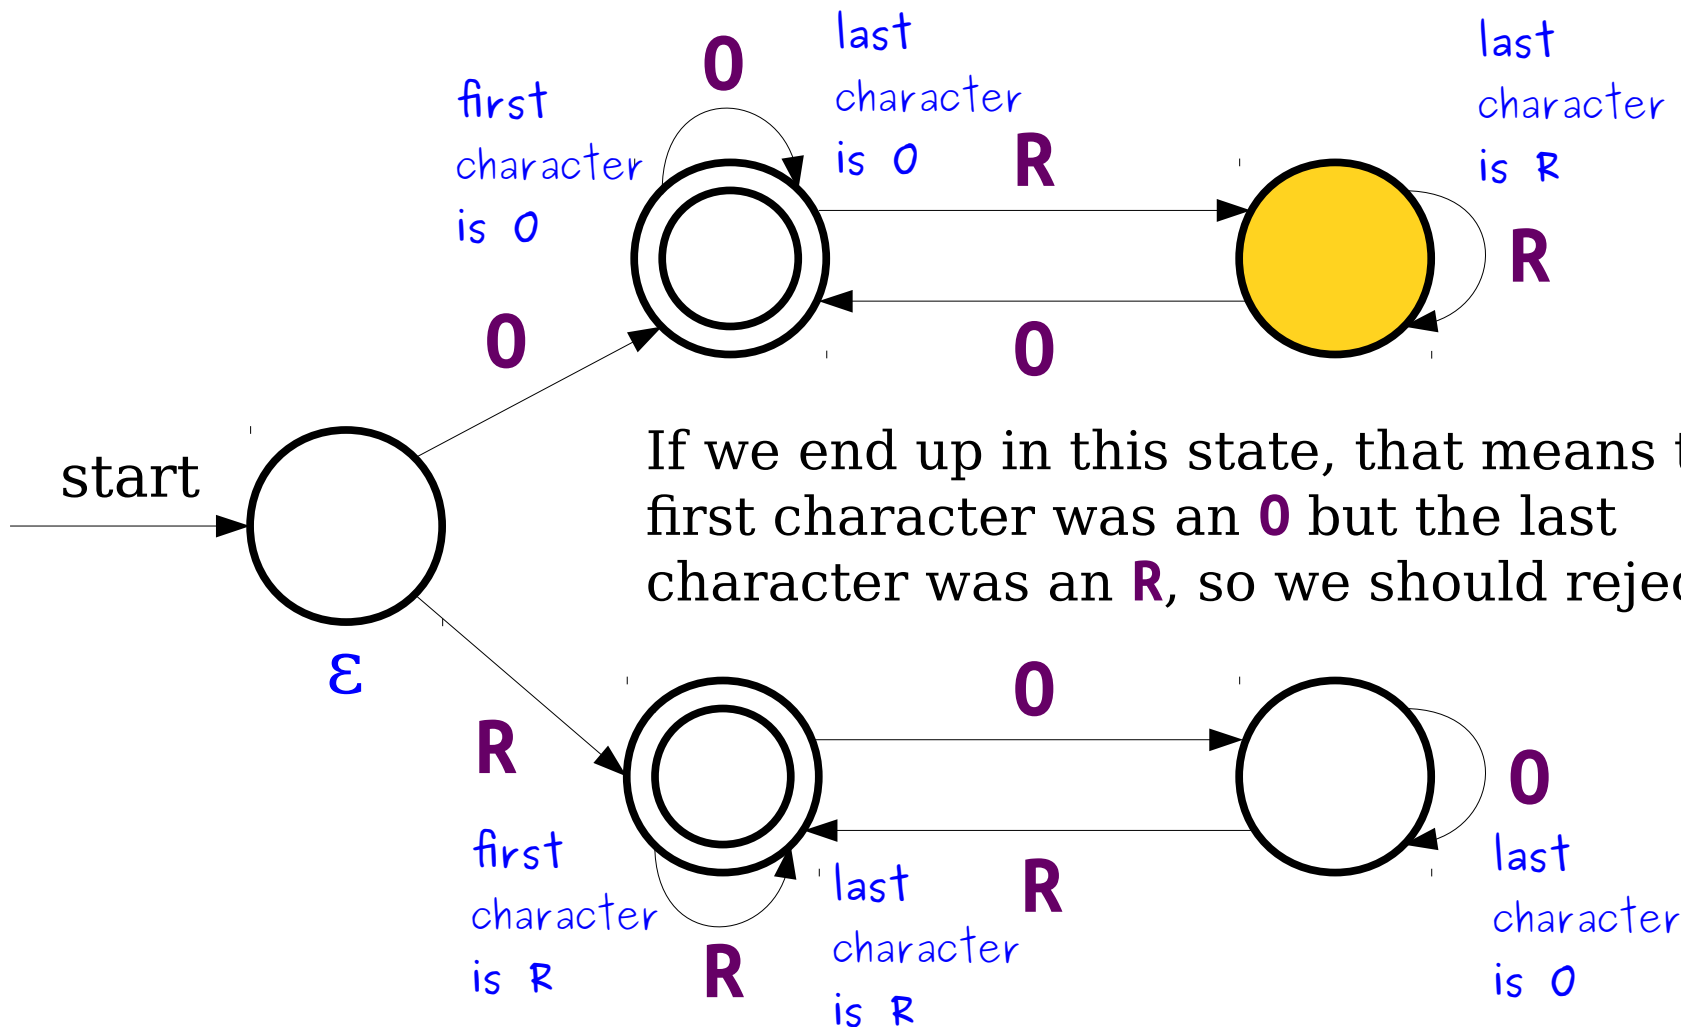

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

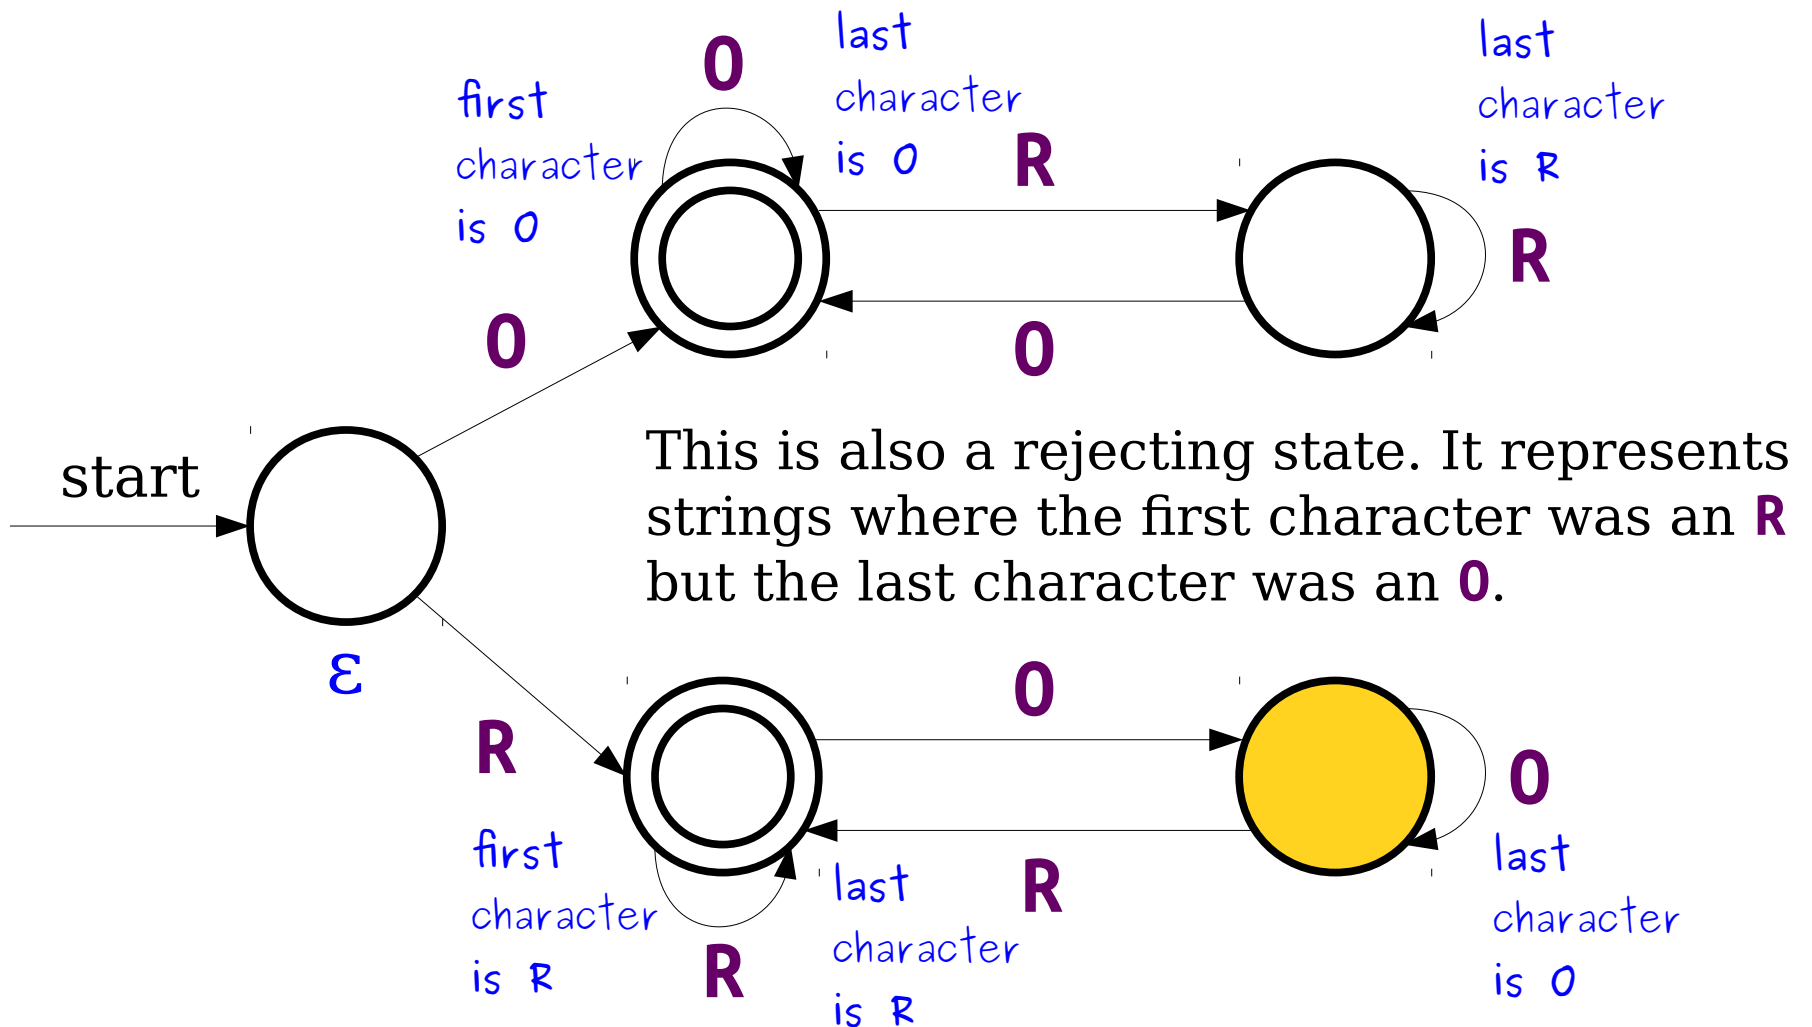

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

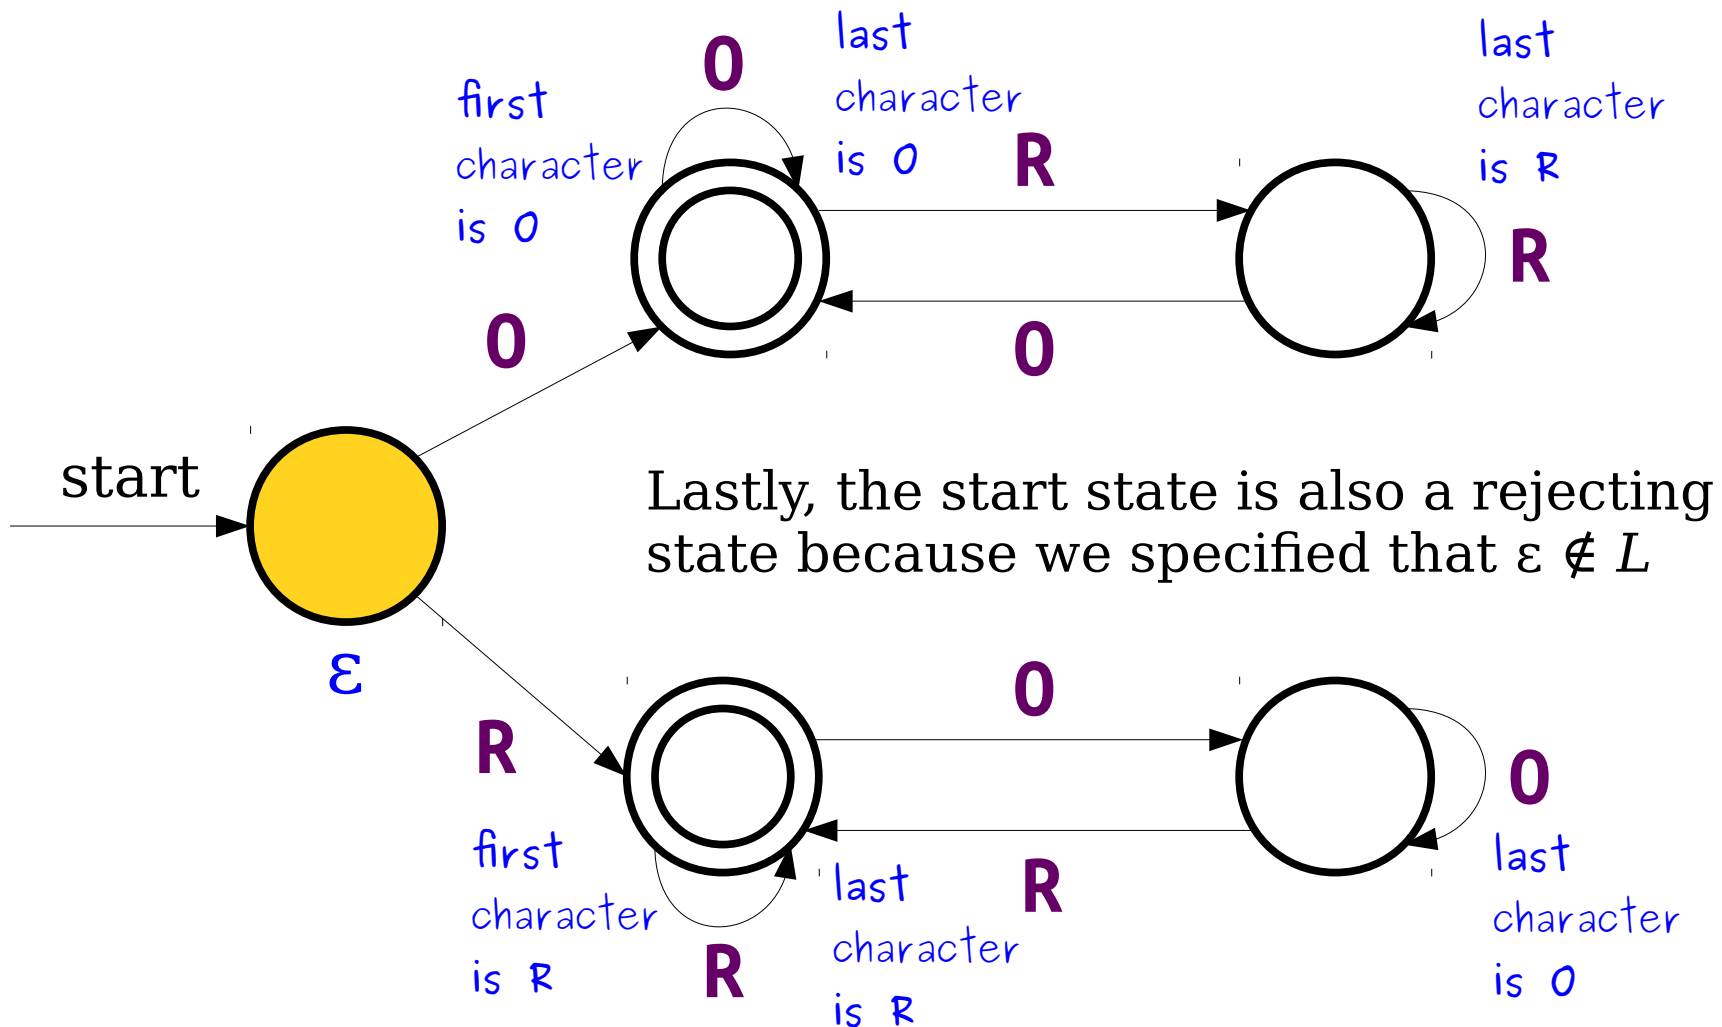

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

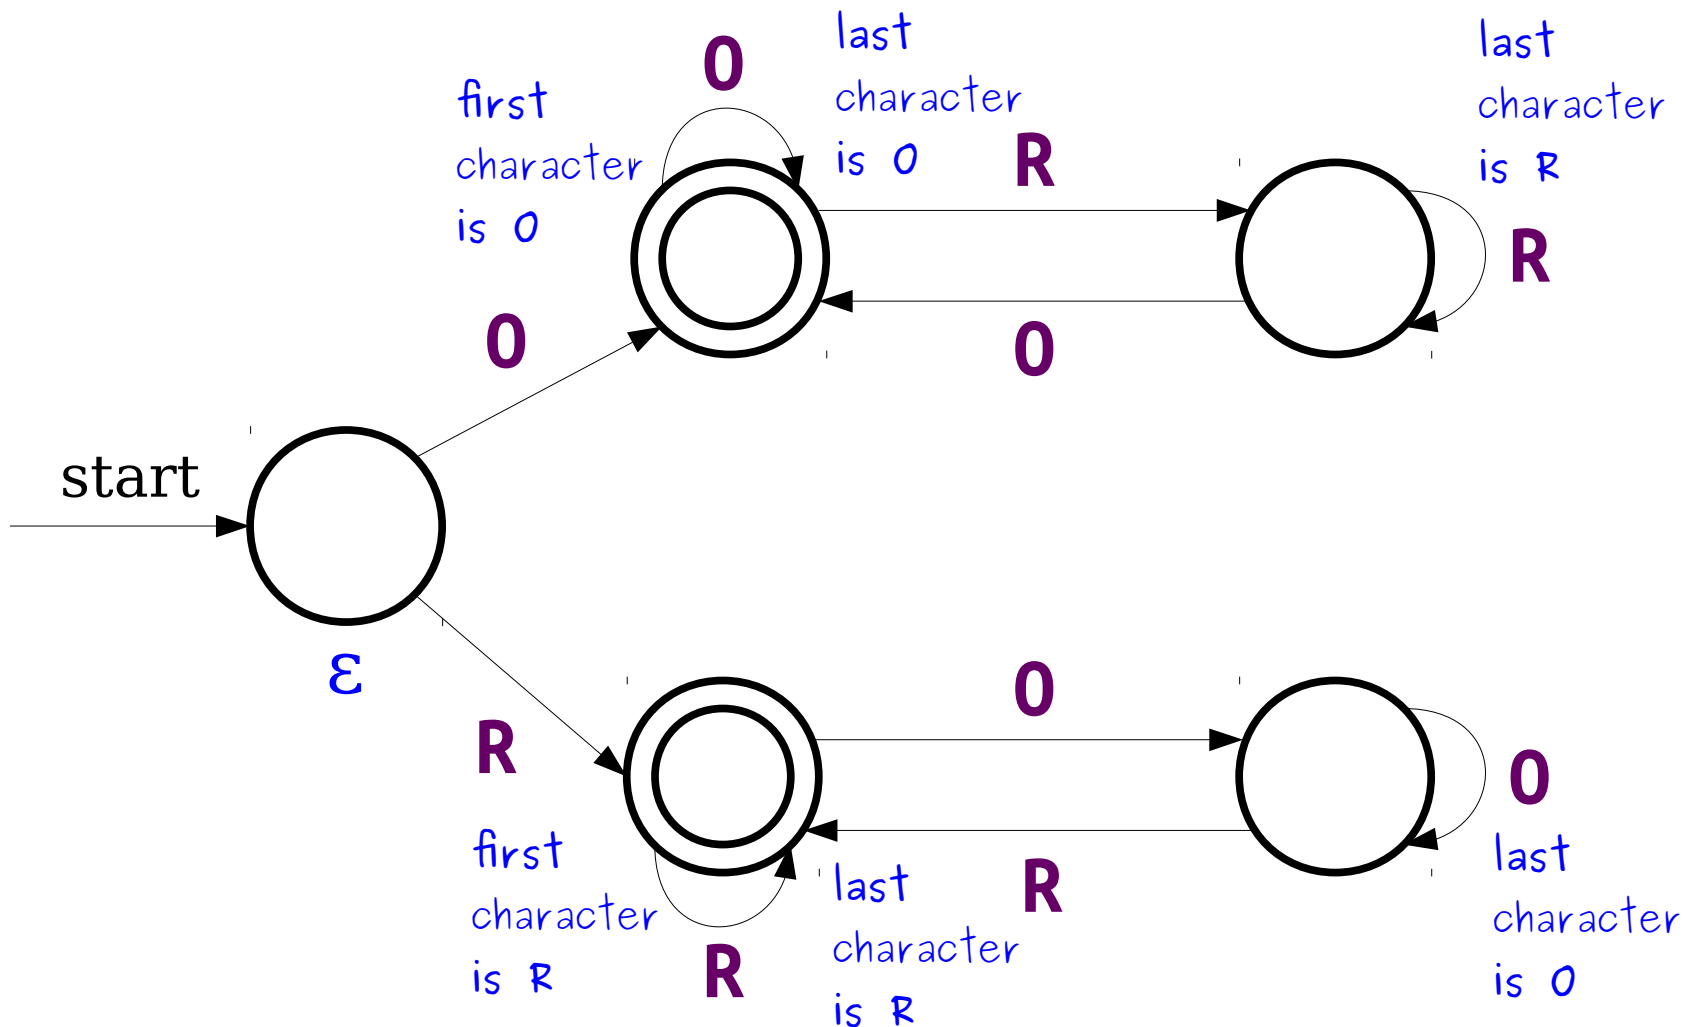

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

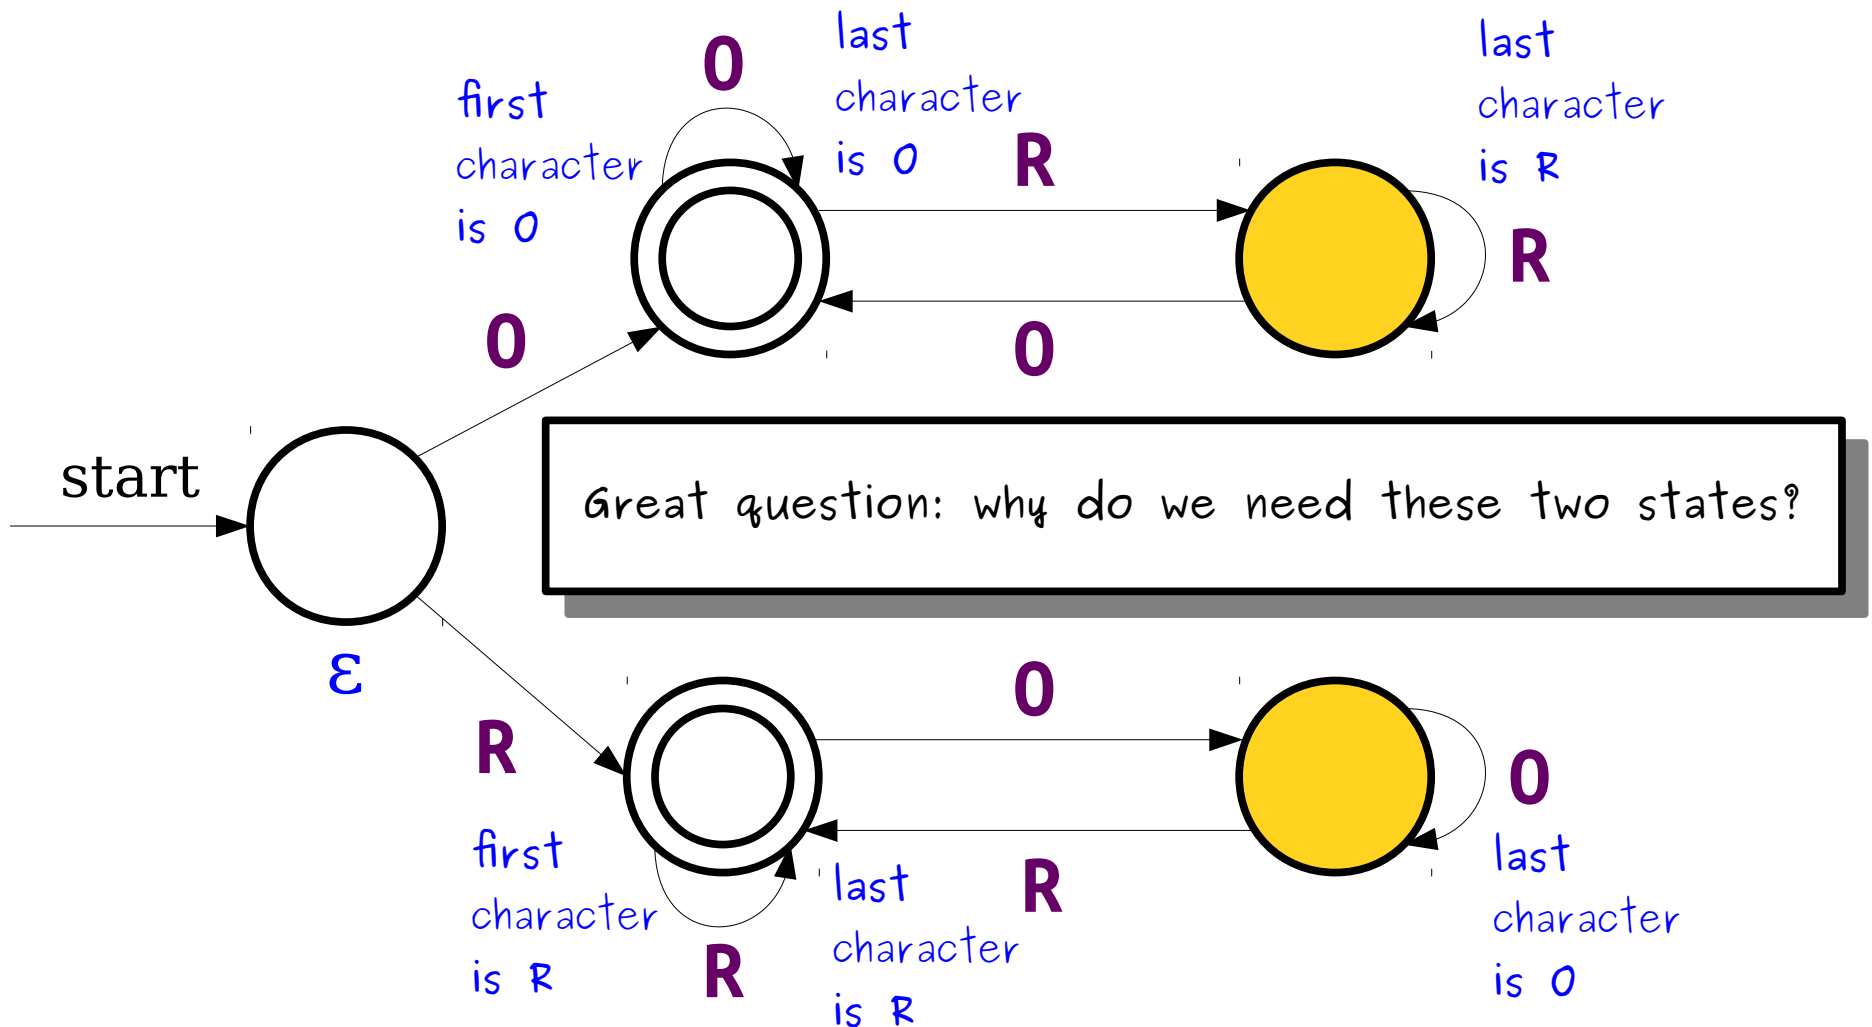

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

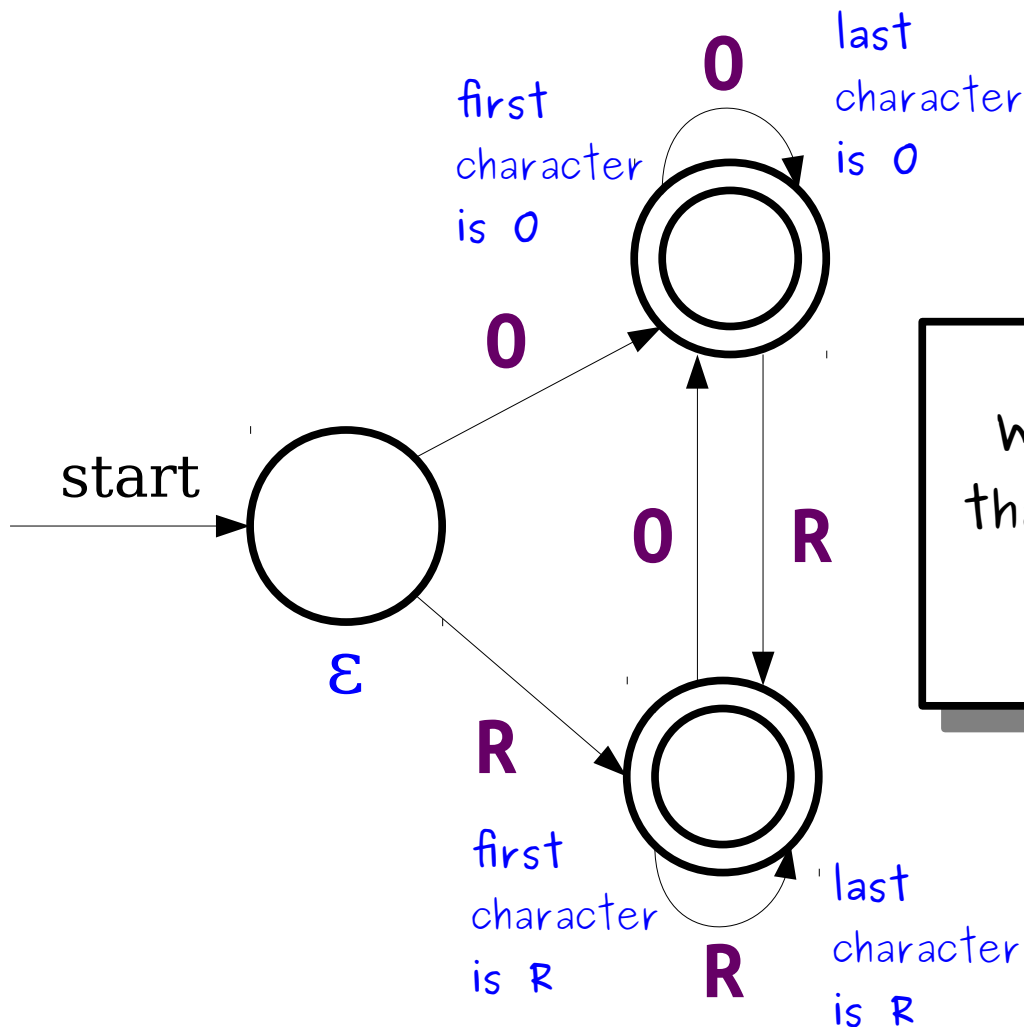

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid w \neq \varepsilon \text{ and the first and last character of } w \text{ are the same} \}$

Why can't we have a DFA that looks like this for this language?

Part 2: *Designing NFAs*

Designing NFAs

- Is there some information that you'd really like to have?
 - Have the machine *nondeterministically guess* that information.
 - Then, have the machine *deterministically check* that the choice was correct.

More Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design an NFA for the language

$$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$$

More Oreo Sandwiches

- Let $\Sigma = \{ \mathbf{O}, \mathbf{R} \}$

Design an NFA for the language

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

$\varepsilon \in L$

$\mathbf{RRR000} \notin L$

$\mathbf{R} \in L$

$\mathbf{OR0ORRO} \notin L$

$\mathbf{ORO} \in L$

$\mathbf{ROROR000} \notin L$

$\mathbf{RRORR} \in L$

More Oreo Sandwiches

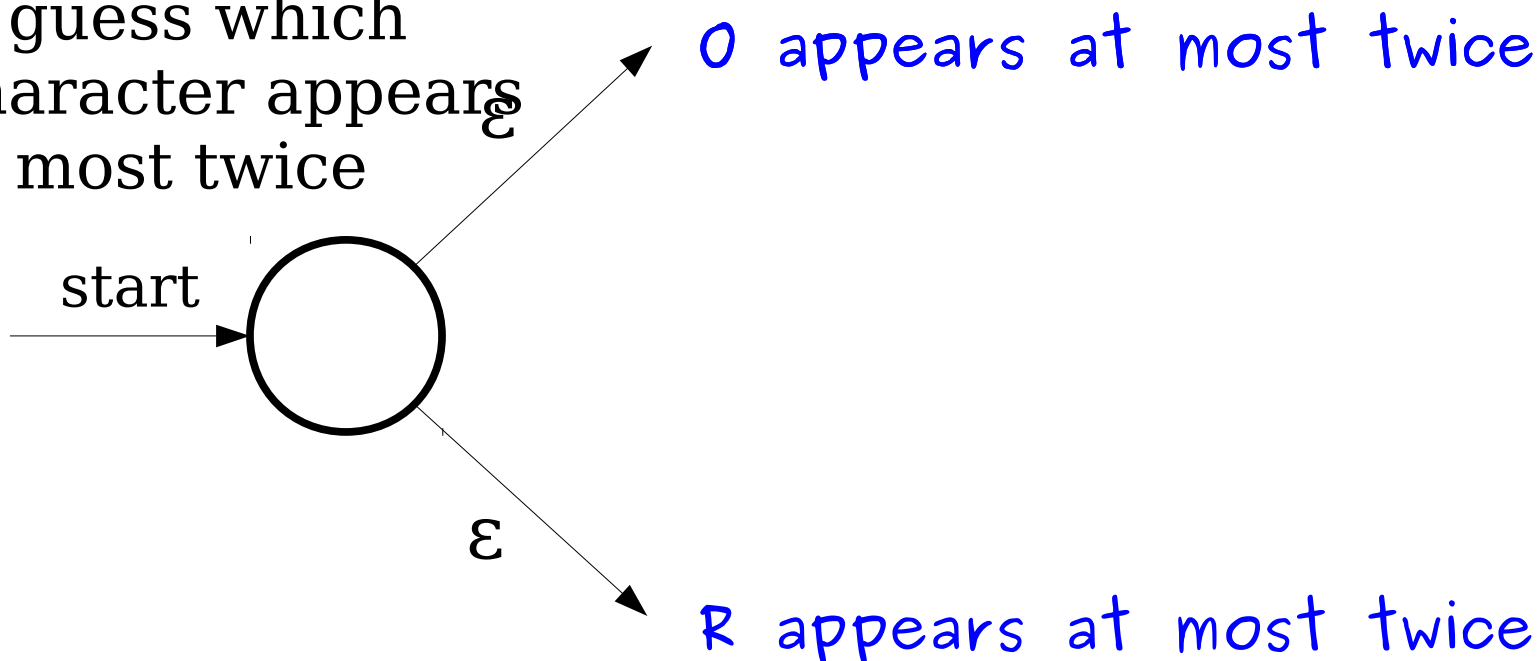

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

More Oreo Sandwiches

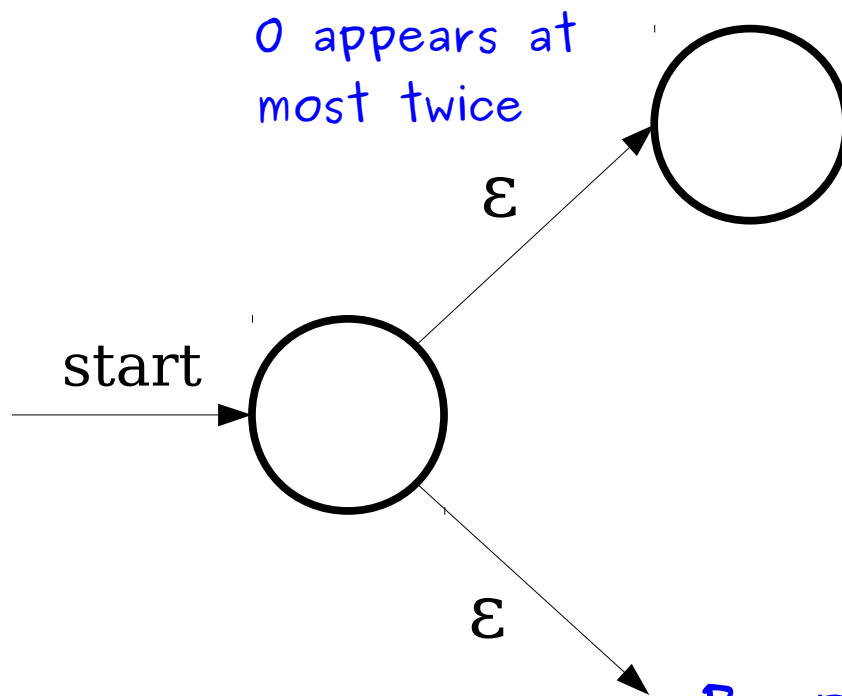

$$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$$

Have the machine nondeterministically guess which character appears at most twice

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

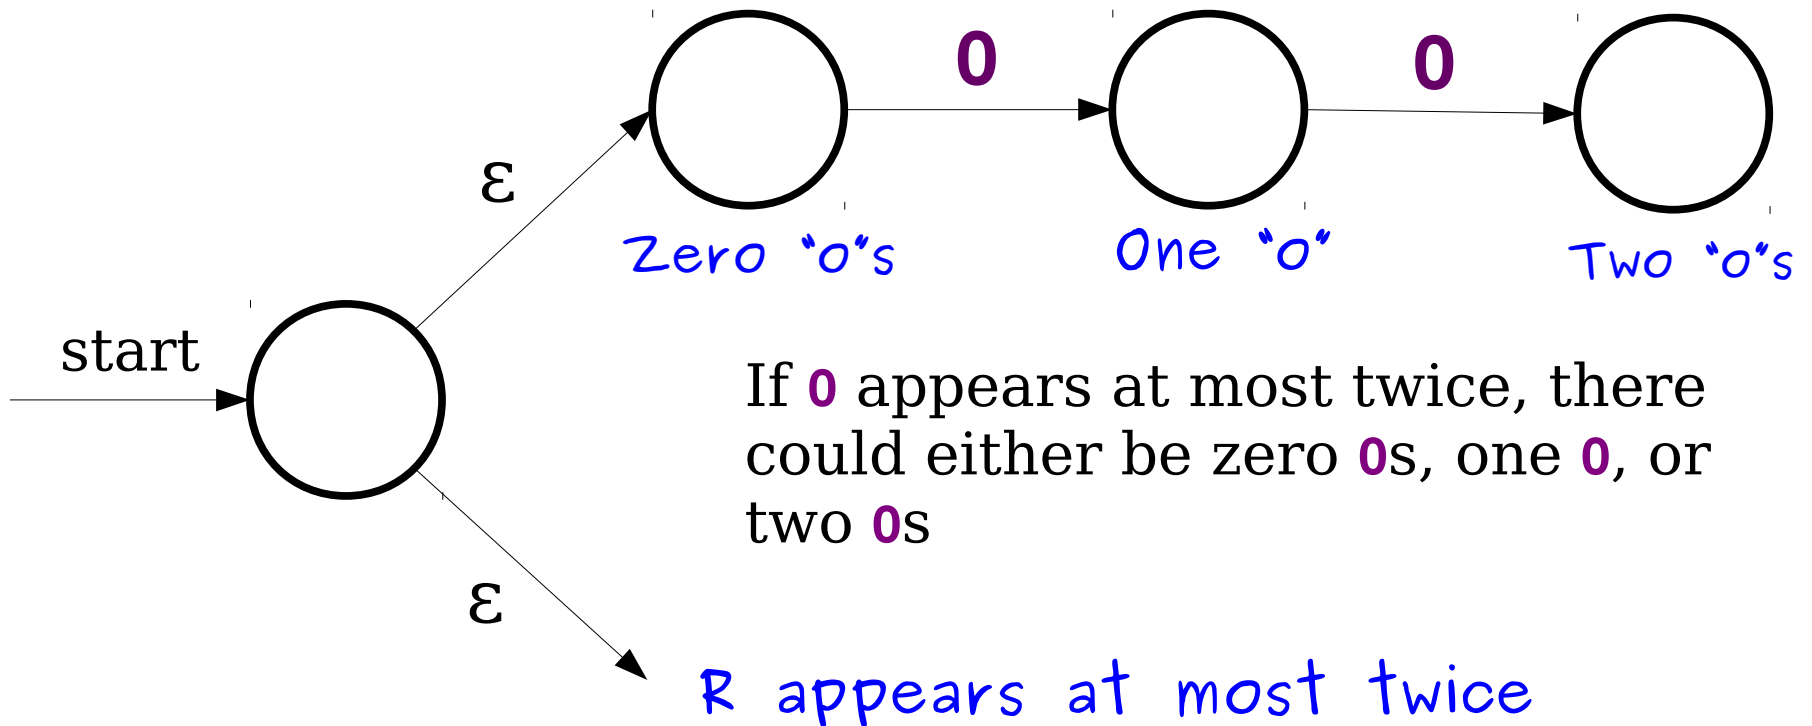

Now, have the machine deterministically check whether or not **0** actually does appear at most twice.

R appears at most twice

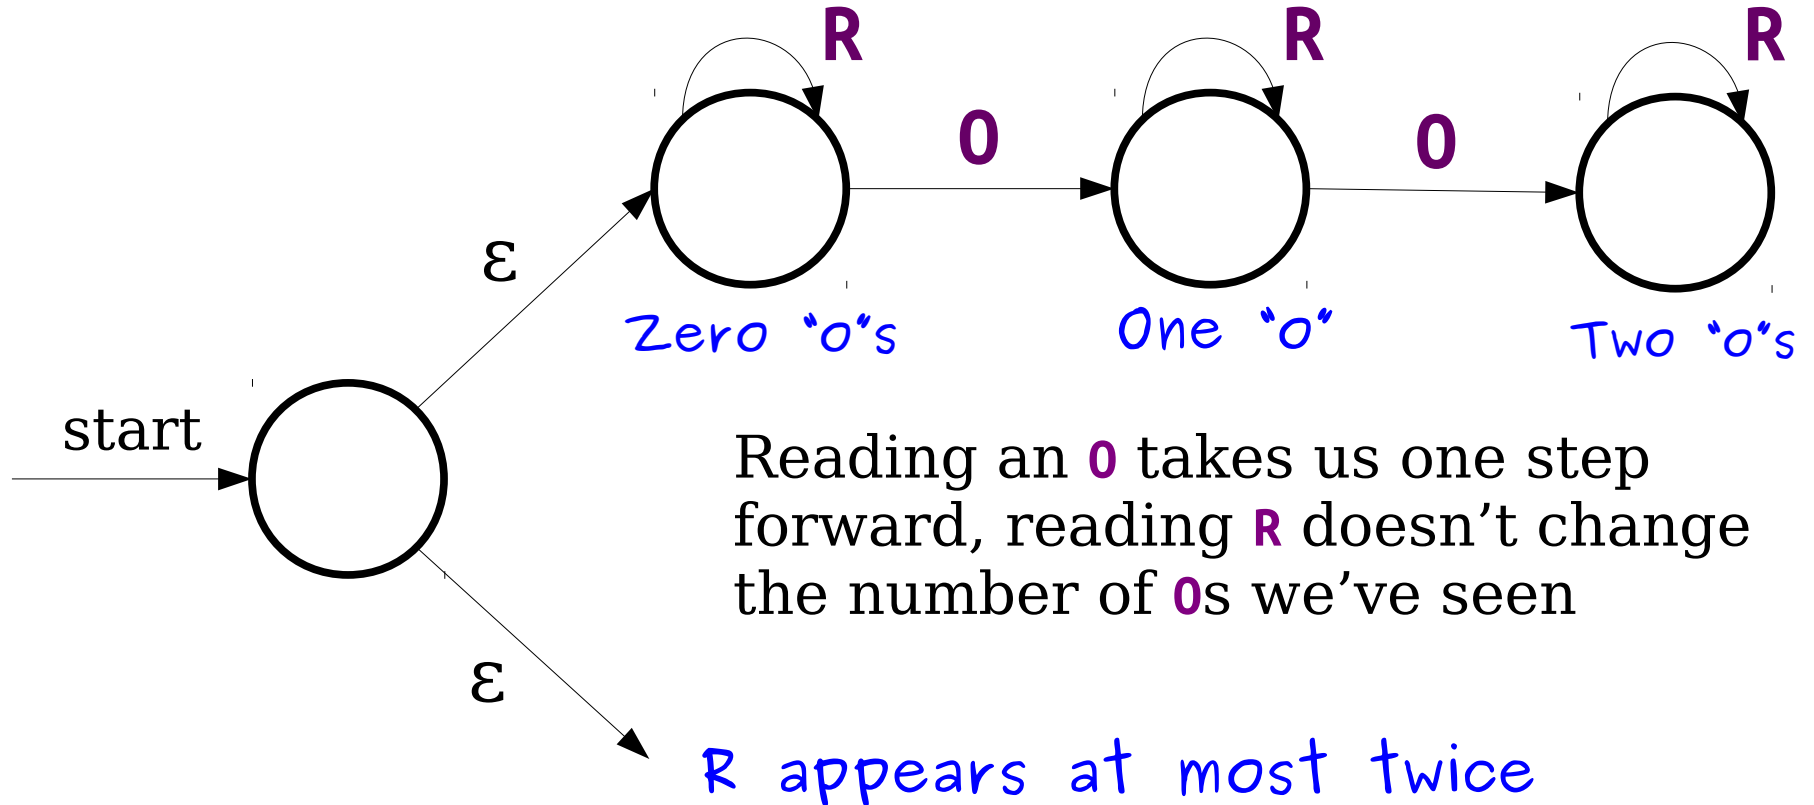

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

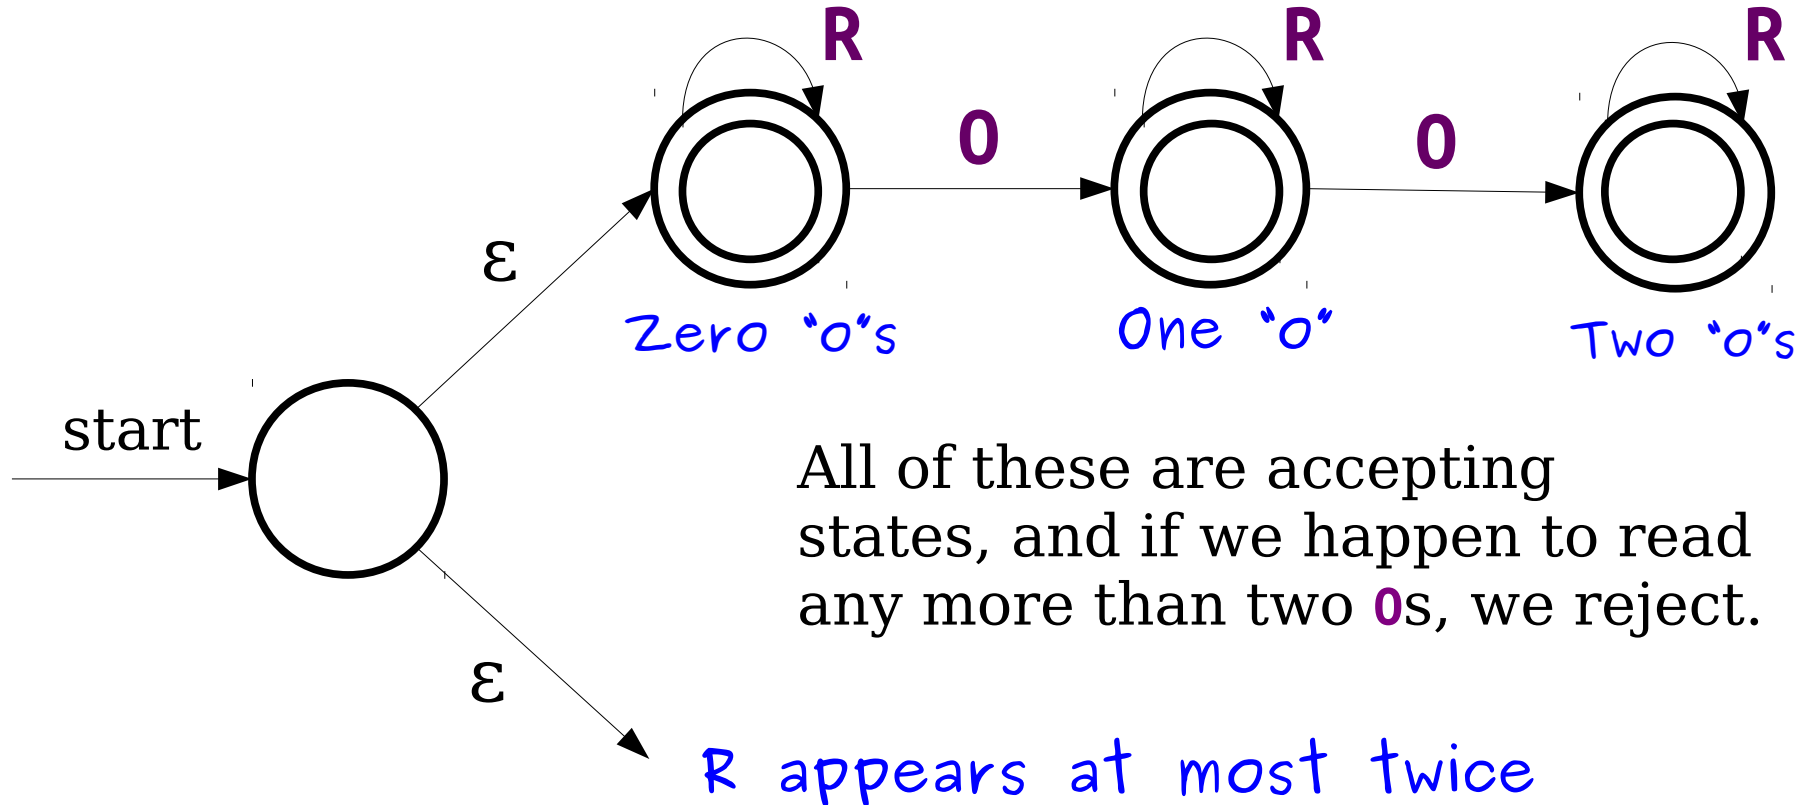

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$

More Oreo Sandwiches

$L = \{ w \in \Sigma^* \mid \text{Some character of } \Sigma \text{ appears at most twice in } w \}$
