

First-Order Logic

Part Two

Recap from Last Time

What is First-Order Logic?

- ***First-order logic*** is a logical system for reasoning about properties of objects.
- Augments the logical connectives from propositional logic with
 - ***predicates*** that describe properties of objects,
 - ***functions*** that map objects to one another, and
 - ***quantifiers*** that allow us to reason about many objects at once.

Some muggle is intelligent.

$\exists m. (Muggle(m) \wedge Intelligent(m))$

\exists is the **existential quantifier** and says "for some choice of m , the following is true."

“For any natural number n ,
 n is even if and only if n^2 is even”

$\forall n. (n \in \mathbb{N} \rightarrow (Even(n) \leftrightarrow Even(n^2)))$

\forall is the **universal quantifier**
and says “for any choice of n ,
the following is true.”

“Some P is a Q ”

translates as

$\exists x. (P(x) \wedge Q(x))$

Useful Intuition:

Existentially-quantified statements are false unless there's a positive example.

$$\exists x. (P(x) \wedge Q(x))$$

If x is an example, it must have property P on top of property Q .

“All P 's are Q 's”

translates as

$\forall x. (P(x) \rightarrow Q(x))$

Useful Intuition:

Universally-quantified statements are true unless there's a counterexample.

$$\forall x. (P(x) \rightarrow Q(x))$$

If x is a counterexample, it must have property P but not have property Q .

New Stuff!

The Aristotelian Forms

“All As are Bs”

$$\forall x. (A(x) \rightarrow B(x))$$

“Some As are Bs”

$$\exists x. (A(x) \wedge B(x))$$

“No As are Bs”

$$\forall x. (A(x) \rightarrow \neg B(x))$$

“Some As aren't Bs”

$$\exists x. (A(x) \wedge \neg B(x))$$

It is worth committing these patterns to memory. We'll be using them throughout the day and they form the backbone of many first-order logic translations.

The Art of Translation

Using the predicates

- $Person(p)$, which states that p is a person, and
- $Loves(x, y)$, which states that x loves y ,

write a sentence in first-order logic that means “every person loves someone else.”

Answer at

<https://pollev.com/cs103aut23>

$$\forall p. (Person(p) \rightarrow$$
$$\quad \exists q. (Person(q) \wedge p \neq q \wedge$$
$$\quad \quad Loves(p, q)$$
$$\quad)$$
$$)$$

Using the predicates

- $Person(p)$, which states that p is a person, and
- $Loves(x, y)$, which states that x loves y ,

write a sentence in first-order logic that means “there is a person that everyone else loves.”

Answer at

<https://pollev.com/cs103aut23>

$$\begin{aligned} & \exists p. (Person(p) \wedge \\ & \quad \forall q. (Person(q) \wedge p \neq q \rightarrow \\ & \quad \quad Loves(q, p) \\ & \quad) \\ &) \end{aligned}$$

Combining Quantifiers

- Most interesting statements in first-order logic require a combination of quantifiers.
- Example: “Every person loves someone else”

For every person... $\forall p. (Person(p) \rightarrow$
... there is another person ... $\exists q. (Person(q) \wedge p \neq q \wedge$
... they love $Loves(p, q)$
)
)

Combining Quantifiers

- Most interesting statements in first-order logic require a combination of quantifiers.
- Example: “There is someone everyone else loves.”

There is a person... $\exists p. (Person(p) \wedge$
... that everyone else ... $\forall q. (Person(q) \wedge p \neq q \rightarrow$
... loves. $Loves(q, p)$
)
)

For Comparison

For every person... $\forall p. (Person(p) \rightarrow$
... there is another person ... $\exists q. (Person(q) \wedge p \neq q \wedge$
... they love $Loves(p, q)$
)
)

There is a person... $\exists p. (Person(p) \wedge$
... that everyone else ... $\forall q. (Person(q) \wedge p \neq q \rightarrow$
... loves. $Loves(q, p)$
)
)

Every Person Loves Someone Else

No one here
is universally
loved.

There is Someone Everyone Else Loves

Every Person Loves Someone Else *and*
There is Someone Everyone Else Loves

For every person... $\forall p. (Person(p) \rightarrow$
 ... there is another person ... $\exists q. (Person(q) \wedge p \neq q \wedge$
 ... they love $Loves(p, q)$
)
)

and \wedge

There is a person... $\exists p. (Person(p) \wedge$
 ... that everyone else ... $\forall q. (Person(q) \wedge p \neq q \rightarrow$
 ... loves. $Loves(q, p)$
)
)

Quantifier Ordering

- The statement

$$\forall x. \exists y. P(x, y)$$

means “for any choice of x , there's some choice of y where $P(x, y)$ is true.”

- The choice of y can be different every time and can depend on x .

Quantifier Ordering

- The statement

$$\exists x. \forall y. P(x, y)$$

means “there is some x where for any choice of y , we get that $P(x, y)$ is true.”

- Since the inner part has to work for any choice of y , this places a lot of constraints on what x can be.

Order matters when mixing existential
and universal quantifiers!

Time-Out for Announcements!

Problem Set Two

- Problem Set One was due today at 1:00PM.
 - You can extend the deadline to 1:00PM Saturday using one of your late days. As usual, no late submissions will be accepted beyond 1:00PM Saturday without prior approval.
- Problem Set Two goes out today. It's due next Friday at 1:00PM.
 - Explore first-order logic!
 - Expand your proofwriting toolkit!
- We have some online readings for this problem set.
 - Check out the ***Guide to Logic Translations*** for more on how to convert from English to FOL.
 - Check out the ***Guide to Negations*** for information about how to negate formulas.
 - Check out the ***First-Order Translation Checklist*** for details on how to check your work.

Back to CS103!

Set Translations

Using the predicates

- $Set(S)$, which states that S is a set, and
- $x \in y$, which states that x is an element of y ,

write a sentence in first-order logic that means “the empty set exists.”

First-order logic doesn't have set operators or symbols “built in.” If we only have the predicates given above, how might we describe this?

$\exists S. (Set(S) \wedge \neg \exists x. x \in S)$

$\exists S. (Set(S) \wedge \forall x. x \notin S)$

Both of these translations are correct. Just like in propositional logic, there are many different equivalent ways of expressing the same statement in first-order logic.

$\exists S. (Set(S) \wedge \neg \exists x. x \in S)$

$\exists S. (Set(S) \wedge \forall x. x \notin S)$

Why can we switch which
quantifier we're using here?

Mechanics: Negating Statements

An Extremely Important Table

	When is this true?	When is this false?
$\forall x. P(x)$	For all objects x , $P(x)$ is true.	There is an x where $P(x)$ is false.
$\exists x. P(x)$	There is an x where $P(x)$ is true.	For all objects x , $P(x)$ is false.
$\forall x. \neg P(x)$	For all objects x , $P(x)$ is false.	There is an x where $P(x)$ is true.
$\exists x. \neg P(x)$	There is an x where $P(x)$ is false.	For all objects x , $P(x)$ is true.

An Extremely Important Table

When is this true?

When is this false?

$$\forall x. P(x)$$

For all objects x ,
 $P(x)$ is true.

$$\exists x. \neg P(x)$$

$$\exists x. P(x)$$

There is an x where
 $P(x)$ is true.

$$\forall x. \neg P(x)$$

$$\forall x. \neg P(x)$$

For all objects x ,
 $P(x)$ is false.

$$\exists x. P(x)$$

$$\exists x. \neg P(x)$$

There is an x where
 $P(x)$ is false.

$$\forall x. P(x)$$

Negating First-Order Statements

- Use the equivalences

$\neg \forall x. A$ is equivalent to $\exists x. \neg A$

$\neg \exists x. A$ is equivalent to $\forall x. \neg A$

to negate quantifiers.

- Mechanically:
 - Push the negation across the quantifier.
 - Change the quantifier from \forall to \exists or vice-versa.
- Use techniques from propositional logic to negate connectives.

Taking a Negation

$\forall x. \exists y. \text{Loves}(x, y)$
(“Everyone loves someone.”)

$\neg \forall x. \exists y. \text{Loves}(x, y)$

$\exists x. \neg \exists y. \text{Loves}(x, y)$

$\exists x. \forall y. \neg \text{Loves}(x, y)$

(“There's someone who doesn't love anyone.”)

Two Useful Equivalences

- The following equivalences are useful when negating statements in first-order logic:

$\neg(p \wedge q)$ is equivalent to $p \rightarrow \neg q$

$\neg(p \rightarrow q)$ is equivalent to $p \wedge \neg q$

- These identities are useful when negating statements involving quantifiers.
 - \wedge is used in existentially-quantified statements.
 - \rightarrow is used in universally-quantified statements.
- When pushing negations across quantifiers, we *strongly recommend* using the above equivalences to keep \rightarrow with \forall and \wedge with \exists .

Negating Quantifiers

- What is the negation of the following statement, which says “there is a cute puppy”?

$$\exists x. (\mathit{Puppy}(x) \wedge \mathit{Cute}(x))$$

- We can obtain it as follows:

$$\neg \exists x. (\mathit{Puppy}(x) \wedge \mathit{Cute}(x))$$

$$\forall x. \neg (\mathit{Puppy}(x) \wedge \mathit{Cute}(x))$$

$$\forall x. (\mathit{Puppy}(x) \rightarrow \neg \mathit{Cute}(x))$$

- This says “no puppy is cute.”
- Do you see why this is the negation of the original statement from both an intuitive and formal perspective?

$\exists S. (Set(S) \wedge \forall x. \neg(x \in S))$
(“There is a set with no elements.”)

$\neg \exists S. (Set(S) \wedge \forall x. \neg(x \in S))$

$\forall S. \neg(Set(S) \wedge \forall x. \neg(x \in S))$

$\forall S. (Set(S) \rightarrow \neg \forall x. \neg(x \in S))$

$\forall S. (Set(S) \rightarrow \exists x. \neg \neg(x \in S))$

$\forall S. (Set(S) \rightarrow \exists x. x \in S)$

(“Every set contains at least one element.”)

Restricted Quantifiers

Quantifying Over Sets

- The notation

$$\forall x \in S. P(x)$$

means “for any element x of set S , $P(x)$ holds.” (It’s vacuously true if S is empty.)

- The notation

$$\exists x \in S. P(x)$$

means “there is an element x of set S where $P(x)$ holds.” (It’s false if S is empty.)

Quantifying Over Sets

- The syntax

$$\forall x \in S. P(x)$$

$$\exists x \in S. P(x)$$

is allowed for quantifying over sets.

- In CS103, feel free to use these restricted quantifiers, but please do not use variants of this syntax.
- For example, don't do things like this:

$$\forall x \text{ with } P(x). Q(x)$$

$$\forall y \text{ such that } P(y) \wedge Q(y). R(y).$$

$$\exists P(x). Q(x)$$

Expressing Uniqueness

Using the predicate

- *WayToFindOut*(w), which states that w is a way to find out,

write a sentence in first-order logic that means “there is only one way to find out.”

$\exists w. (WayToFindOut(w) \wedge$
 $\forall x. (WayToFindOut(x) \rightarrow x = w)$
)

Expressing Uniqueness

- To express the idea that there is exactly one object with some property, we write that
 - there exists at least one object with that property, and that
 - there are no other objects with that property.
- You sometimes see a special “uniqueness quantifier” used to express this:

$$\exists!x. P(x)$$

- For the purposes of CS103, please do not use this quantifier. We want to give you more practice using the regular \forall and \exists quantifiers.

Next Time

- ***Functions***
 - How do we model transformations and pairings?
- ***First-Order Definitions***
 - Where does first-order logic come into all of this?
- ***Proofs with Definitions***
 - How does first-order logic interact with proofs?
