# Announcements

---

## Office Hours:

- Tue-Thu after class, right here!
-

# Quick Recap

---

- We spent last class talking about the idea behind C++ streams
    - `istream`, `ostream`, `stringstream`
    - `>>`, `<<`, `getline`
  - Today we will explore some of the difficulties that come with using them in practice.
-

C makes it easy to shoot yourself in the foot;  
C++ makes it harder, but when you do it blows  
away your whole leg.

--Bjarne Stroustrup

---

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- Unread data sits on the stream
  - A stream which has failed stays failed
  - Mixing `>>` and `getline`
  - Putting it all together
  - Understanding the Stanford library functions
-

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- **Unread data sits on the stream**
  - A stream which has failed stays failed
  - Mixing `>>` and `getline`
  - Putting it all together
  - Understanding the Stanford library functions
-

# Unread Data

---

- If we read an integer from `cin`, and the user types "42 foo", we will read the integer 42.
  - However, the data " foo" will still be sitting on `cin`.
  - So, if we try and read another integer from the stream, it will fail before the user even gets to enter any input.
-

# Unread Data

---

`cin` starts off with no input in it

```
int value;  
cin >> value; // value == ?
```

---

# Unread Data

---

The user types in input, including some trailing garbage, in this case “foo”

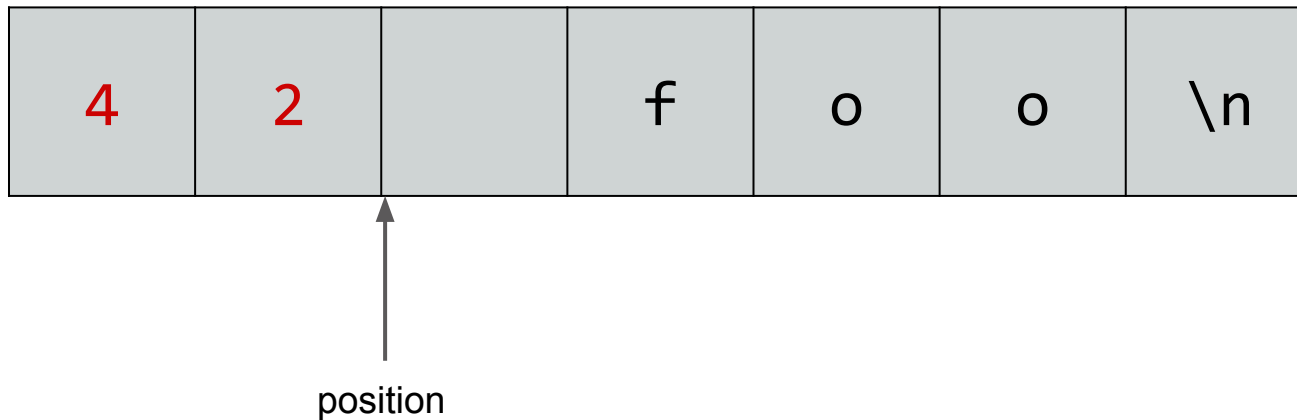

```
int value;  
cin >> value; // value == ?
```

---

# Unread Data

---

The first read of `cin` will successfully read '42'

```
int value;  
cin >> value; // value == 42
```

---

# Unread Data

---

The second read of `cin` will occur, but the program will not ask for more input

```
int secondValue;  
cin >> secondValue; // ???
```

---

# Unread Data

---

The second read of `cin` will fail, since “foo” cannot be interpreted as an integer

```
int secondValue;  
cin >> secondValue; // ???
```

---

# Unread Data

---

Let's take a look at this problem in an example  
getInteger function  
(StaysOnStream.pro)

---

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- Unread data sits on the stream
  - **A stream which has failed stays failed**
  - Mixing `>>` and `getline`
  - Putting it all together
  - Understanding the Stanford library functions
-

# Once failed, stays failed

---

- If we try and read an int from a stream containing only the data "hello", the operation will fail, and the **fail bit** will be set.
    - The same applies if you try and read a double when the string contains only a string, etc.
  - The fail bit will remain set until you explicitly call `.clear()`.
  - Let's take a look at a code snippet demonstrating that
-

# Once failed, stays failed

---

Let's take a look at this problem  
(StaysFailed.pro)

---

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- Unread data sits on the stream
  - A stream which has failed stays failed
  - **Mixing >> and getline**
  - Putting it all together
  - Understanding the Stanford library functions
-

# Mixing >> and getline

---

Let's see what happens when mix >> and  
getline. See if you can guess what goes wrong  
(MixingGetline.pro)

---

# Mixing >> and getline

---

`cin` starts off with no input on it

```
int value;  
cin >> value; // value == ?
```

---

# Mixing >> and getline

---

The user types in input, a newline at the end

```
int value;  
cin >> value;
```

---

# Mixing >> and getline

---

The first read of `cin` will successfully read '20'

```
int numUnits;  
cin >> numUnits; // numUnits == 20
```

---

# Mixing >> and getline

---

The call to `getline` will read the newline still sitting on the buffer!

```
string favoriteClass;  
getline(cin, favoriteClass);
```

---

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- Unread data sits on the stream
  - A stream which has failed stays failed
  - Mixing `>>` and `getline`
  - **Putting it all together**
  - Understanding the Stanford library functions
-

# Putting It Together

---

Let's try putting this together and writing a complete program.

- We will read a number from the user and do some manipulation on it
  - We will only accept the user's input if it contains a valid integer, and nothing but a valid integer (no trailing junk)
-

# Putting It Together

---

Let's take a look at this problem  
(PutTogether.pro)

---

# Complicated Parts

---

We're now ready to talk about some of the messy parts of working with streams.

- Unread data sits on the stream
  - A stream which has failed stays failed
  - Mixing `>>` and `getline`
  - Putting it all together
  - **Understanding the Stanford library functions**
-

# Stanford Libraries

---

Now that we've had some exposure to streams, we can actually understand what the Stanford library functions are doing under the hood!

| <code>simpio.h</code>   | <code>strlib.h</code>  |
|---|--|
| <code>getInteger</code><br><code>getReal</code><br><code>getLine</code> | <code>intToString</code><br><code>realToString</code><br><code>stringToInt</code><br><code>stringToReal</code> |

---

# Stanford Libraries

---

```
// getLine is pretty easy to write
string getLine() {
    string line;
    getline(cin, line);
    return line;
}
```

---

# Stanford Libraries

---

Okay, so `getLine` was pretty easy to write. How about the rest?

| <code>simpio.h</code>  | <code>strlib.h</code>  |
|--|--|
| <code>getInteger</code><br><code>getReal</code><br><code><del>getLine</del></code> | <code>intToString</code><br><code>realToString</code><br><code>stringToInt</code><br><code>stringToReal</code> |

---

# Stanford Libraries

---

Let's take a look at `getInteger` (`getReal` is similar).

See code in `SimpleIO.pro`

| <code>simpio.h</code>  | <code>strlib.h</code>  |
|--|--|
| <del><code>getInteger</code></del><br><del><code>getReal</code></del><br><del><code>getLine</code></del> | <code>intToString</code><br><code>realToString</code><br><code>stringToInt</code><br><code>stringToReal</code> |

---

# Stanford Libraries

---

Let's take a look at the functions in "strlib.h"  
now

See code in StrLib.pro

| <code>simpio.h</code>  | <code>strlib.h</code>  |
|--|--|
| <del><code>getInteger</code></del><br><del><code>getReal</code></del><br><del><code>getLine</code></del> | <del><code>intToString</code></del><br><del><code>realToString</code></del><br><del><code>stringToInt</code></del><br><del><code>stringToReal</code></del> |

---

# Awesome Shortcut

---

Instead of doing:

```
while (true) {  
    stream >> value;  
    if (stream.fail()) break;  
    //stuff  
}
```

---

# Awesome Shortcut

---

Do:

```
while (stream >> value) {  
    //stuff  
}
```

Why?

---

# Awesome Shortcut

---

Stream extraction/insertion returns the stream

```
cout << "Hello World" << endl;
```

is equivalent to:

```
(cout << "Hello World") << endl;
```

---

# Awesome Shortcut

---

Streams return the negation of the **fail bit** when evaluated as a boolean

```
if (stream)
```

is equivalent to

```
if (!stream.fail())
```

---

# Stream Manipulation

---

- The `setw` (set whitespace) method allows you to pad your output

```
cout << “[“ << setw(10) << “Hi!” <<
      “]” << endl;
```

Will output

```
[      Hi!]
```

---

# Stream Manipulation

---

- To switch the padding from the left to the right of the input use the keyword `right`

```
cout << “[“ << right << setw(10) <<  
    “Hi!” << “]” << endl;
```

Will output

```
[Hi!           ]
```

---

# Stream Manipulation

---

- The padding is all spaces by default but you can change that by using the `setfill` manipulator

```
cout << “[“ << setfill(‘!’) << right  
<< setw(10) << “Hi!” << “]” << endl;
```

Will output

```
[Hi!!!!!!!!]
```

---

# Stream Manipulation

---

- Other manipulators include changing the base of a number and the format of the output

```
cout << hex << 10; //prints a
```

```
cout << oct << 10; //prints 8
```

# Closing Thoughts

---

C++ streams are definitely not simple, but once you understand them, you'll get used to their quirks and understand their usefulness.

---

# Next Class

---

- Assignment 1 goes out
  - Start looking at standard C++ collection classes
-
