Meet Our Team: Pissionaries

Value Proposition:

PISSION helps you map out restrooms before you even leave the house, so you can focus on your journey, not your next stop.

Meet Our Team: Pissionaries

Problem

Planning for restroom stops in advance can be challenging, especially when traveling or visiting unfamiliar places. Traditional location apps don't offer specific, reliable restroom information to help with pre-planning.

Solution

PISSION enables users to plan ahead by providing detailed, crowd-sourced restroom information, allowing them to map out clean, accessible restroom stops before they set out.

Presentation Overview

01

Realizations

Pros and Cons, Selected
Interface

02

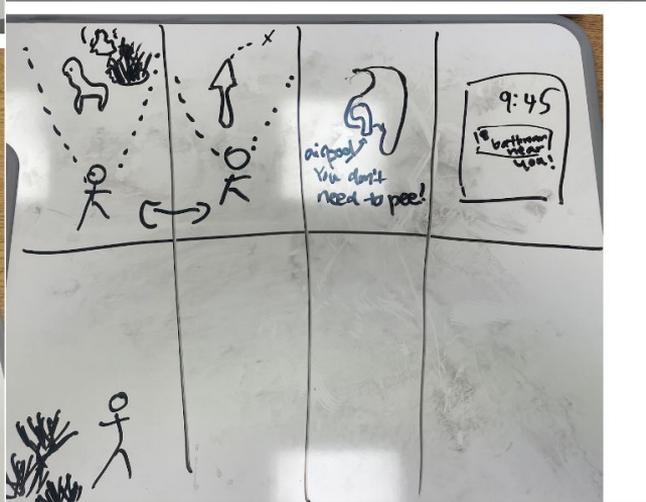

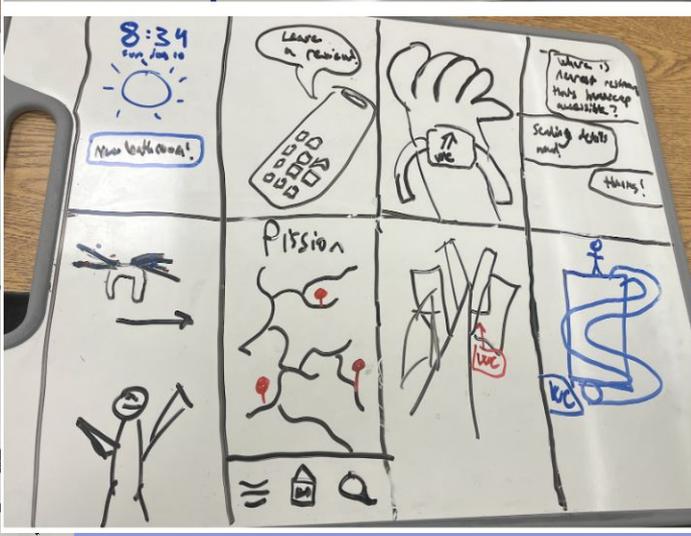

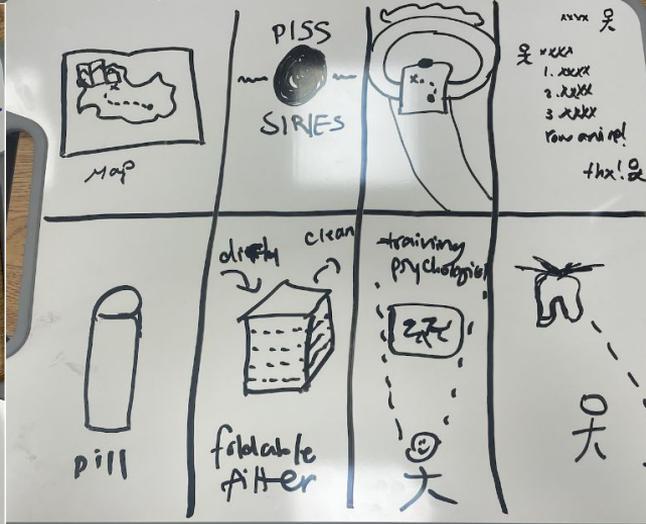

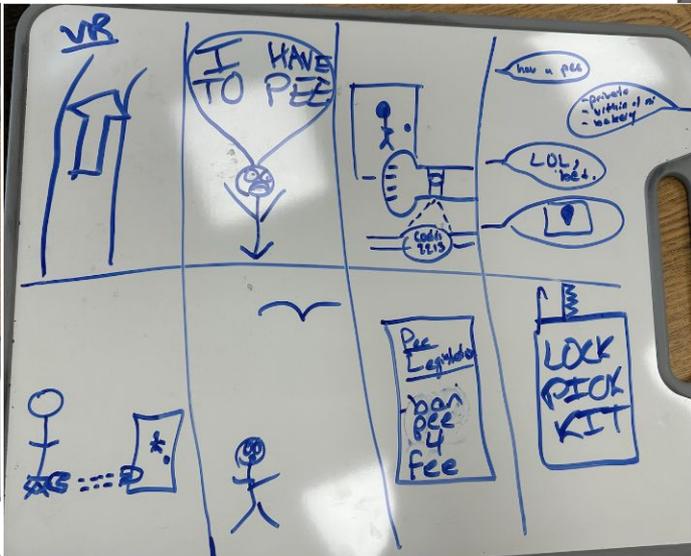

Low-Fi Prototypes

Simple, Moderate,
Complex Tasks, Task Flow

03

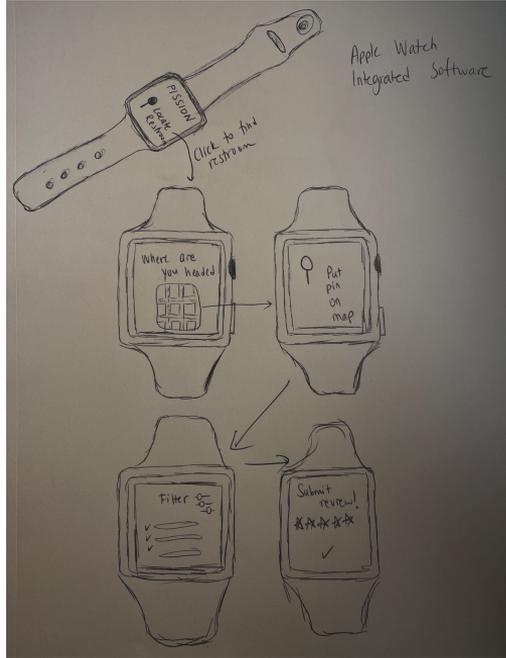

Prototype Testing

Participants, Usability Tests,
Discussion

Sketching Exploration

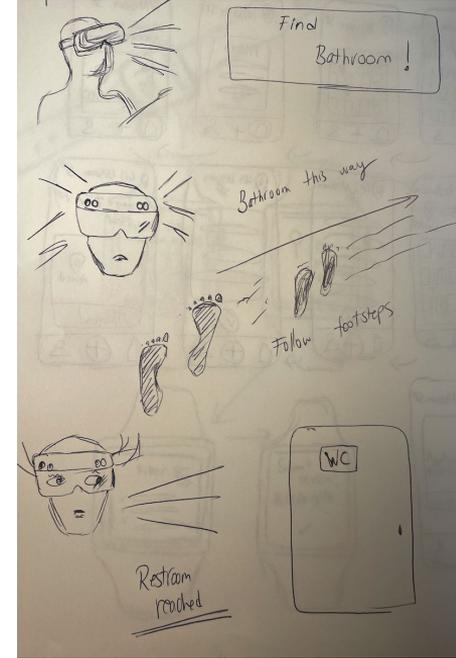

Apple Watch

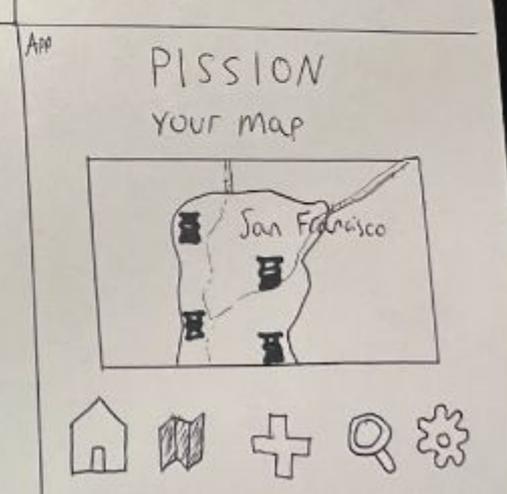

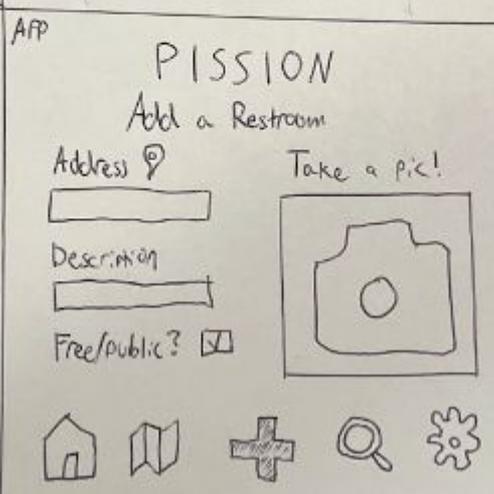

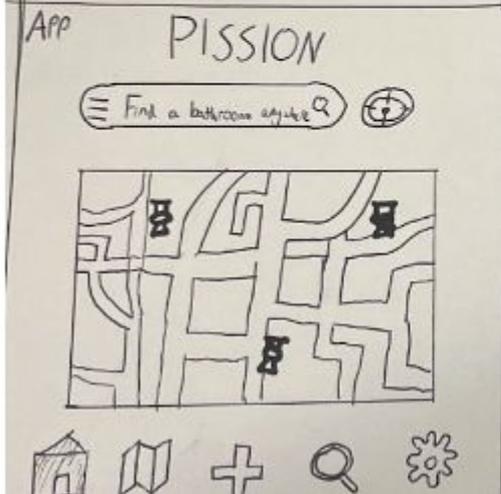

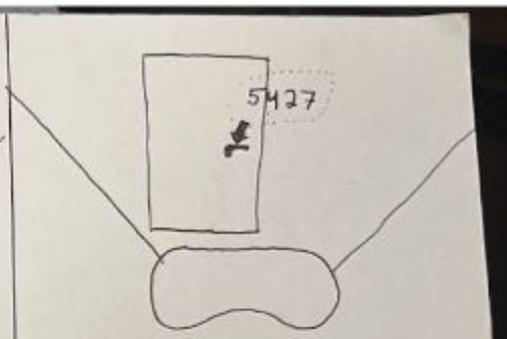

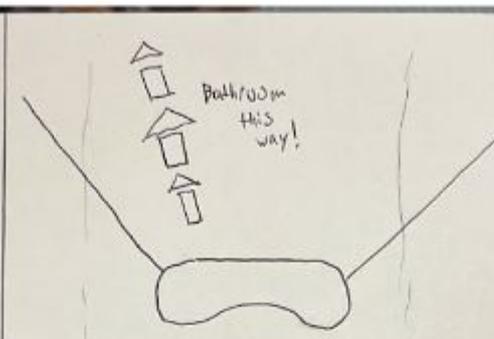

Mobile App

AR/VR

Evaluation: Top 2 Realizations

	Mobile App	AR/VR
Pros	<ul style="list-style-type: none">● Ubiquitous: People always carry their phone when out and about● Onboarding: People know how to use their phone already● Easy to Update: push updates	<ul style="list-style-type: none">● Immersive experience● Hands-free navigation (if AR/VR headset)
Cons	<ul style="list-style-type: none">● Users may not want to download an app solely for finding restrooms● Hard to integrate audio for visually challenged people	<ul style="list-style-type: none">● AR/VR headset not practical on the streets● AR/VR headset not accessible to many potential users● Requires more complex real-time data processing (other than location tracking)● Tasks can be completed without AR at much lower engineering cost

Selected Interface: Mobile App

Why Mobile App?

1. Ubiquitous + easy onboarding
 - 70% of the world's population are smartphone users [2023]
 - 90% of US adults are smartphone users [2023]
2. Easy to update changes on the App Store
3. More simple real-time data processing: location tracking

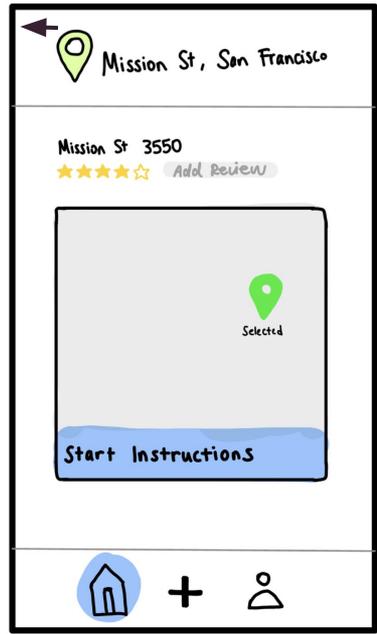

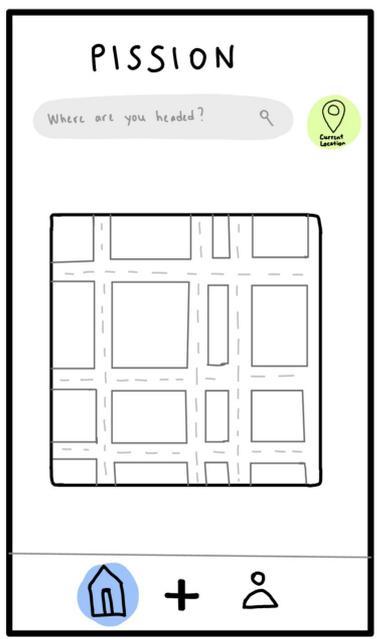

Why not AR/VR?

1. VR: doesn't make sense
2. AR headset: inaccessible, not practical
 - a. 13% of US households have one VR headset [2023]
3. AR mobile: more complex data-processing, tasks can be done without at much lower engineering cost

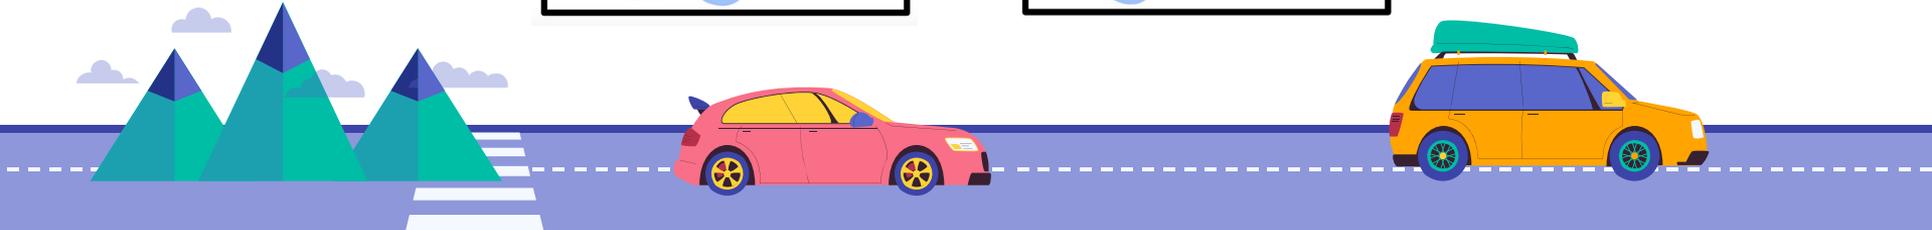

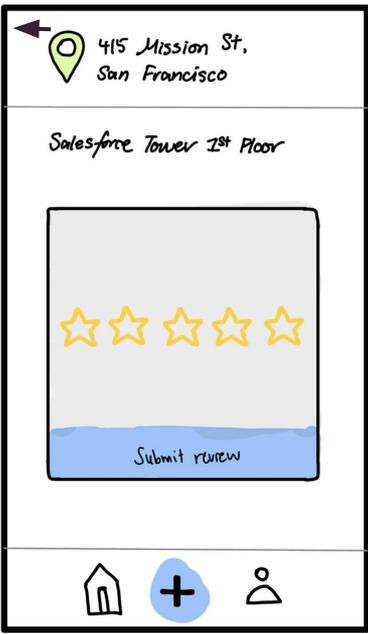

Low-Fi Prototype

Simple Task: Find a Washroom

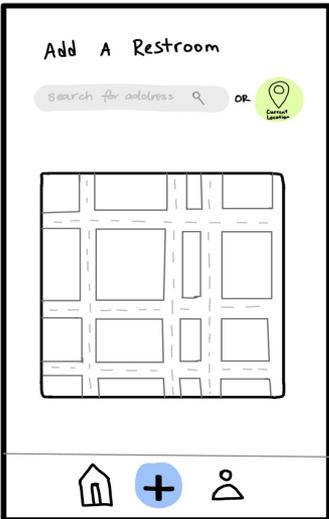

Low-Fi Prototype

Moderate Task: Filter or Rate a Restroom

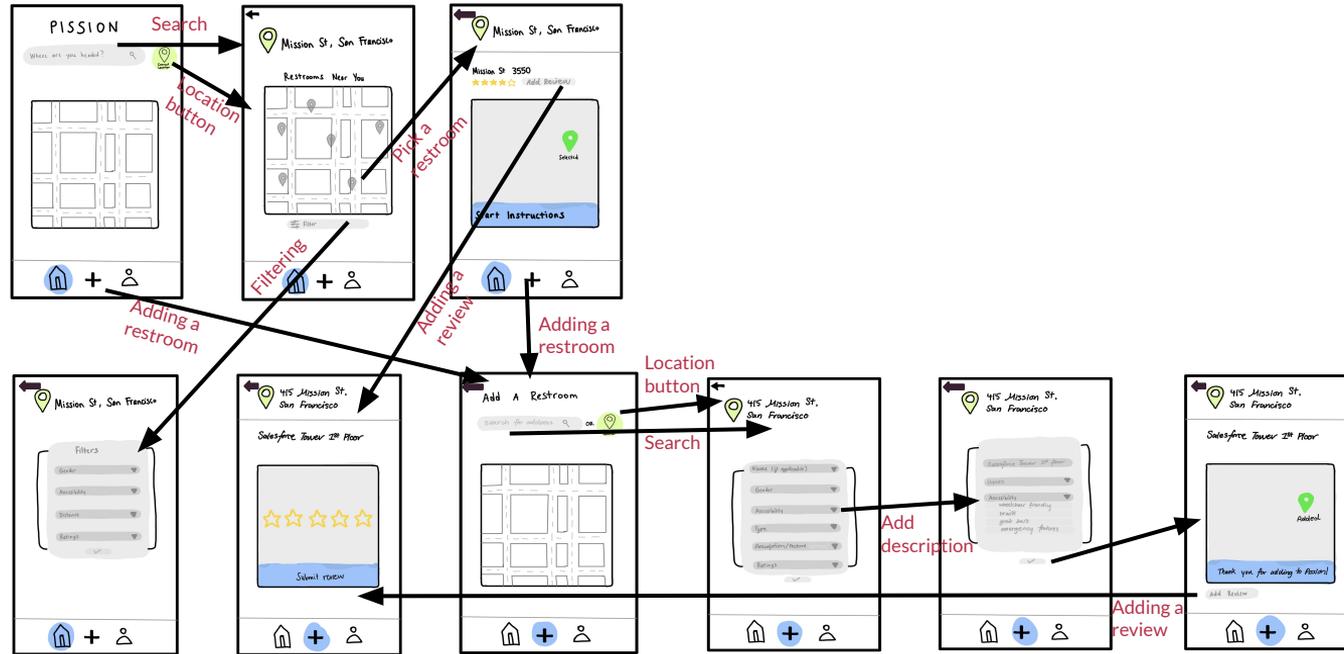

Low-Fi Prototype

Difficult Task: Add a Restroom

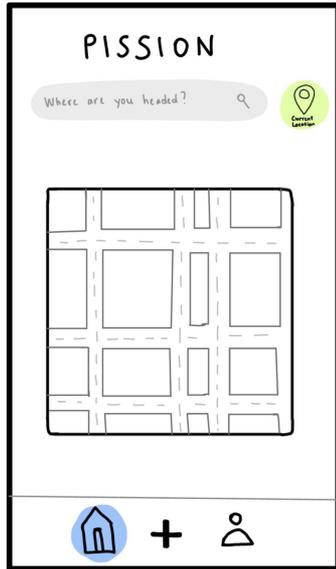

Complete Task Flow

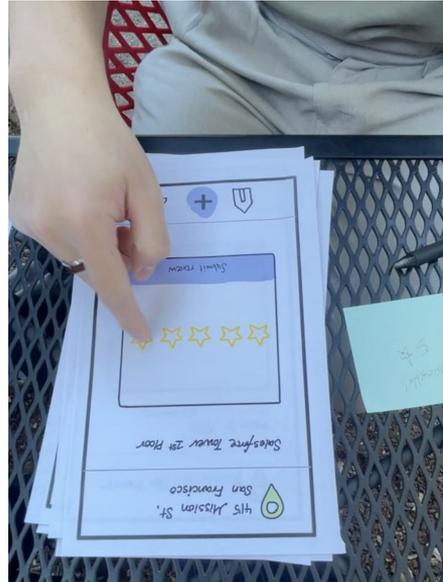

Prototype Build Process

Usability Testing

Procedure

- Approached potential testing interviewees and asked if they had 5 mins to test our low-fidelity prototype
- Odin: narrated the demo
- Merve: controlled the flow of low-fi prototype slides
- Darynne: took notes and synthesized critical insights and design changes
- Andreas: recorded video

Usability Testing

Usability Goal #1: Easy Navigation and Search

- Objective: Users can quickly find nearby washrooms and access relevant information.
- Process Data: Number of steps users go through to find a washroom on the prototype
- Bottom-line Data: The total time it takes for the users to find a washroom from start to finish / the percentage of participants who successfully find a washroom without assistance

4-6 clicks
2 mins

Usability Goal #2: Streamlined contribution process

- Objective: Ensure users can easily contribute washrooms and upload photos without getting stuck
- Process data: number of steps users take to complete the contribution process
- Bottom-line data: completion time

9-10 clicks
3 mins

Usability Testing

Observations + Takeaways

- Users are confused between the ratings in the filtering vs post-restroom evaluation
- Initial + and ✓ after filling details is confusing

- Didn't see the Filter feature
- Too many details to add (e.g. What is "Type"?)
- Add review before or after successfully adding a restroom
- Add restrooms by dropping pin (rather than current location or entering address)

- Thought "Name" was the user's name
- One user thought the map was a general map rather than a restroom map
- Users always chose "current location" rather than type in an address, but they see both

USABILITY
CATASTROPHE

MAJOR USABILITY
PROBLEM

MINOR USABILITY
PROBLEM

Discussion

Take-aways / future changes

- Ensure the choice between “current location” vs “enter an address” (e.g. same background color)
- Move the Filter feature near the search bar + Bigger
- Only keep the necessary information fields when adding a restroom
- Clear UI distinction between ratings post-washroom (stars format) and filtering (text saying “5 stars”)
- Allow the function to add a restroom by pin drop

Limitations of the test

- We didn't have a “profiles” page even though that was a button option
- Users couldn't view the options for the filters so they had to guess

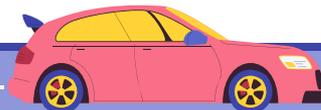

THANK YOU!

QUESTIONS?

Appendix 1: Evaluating Realizations

	Mobile App	AR
Pros	<ul style="list-style-type: none">• We are in 147L• Ubiquitous• People always carry their phone when out and about• People know how to use their phone• Faster solution• Easy to Update (push updates)	<ul style="list-style-type: none">• Immersive experience for finding the restroom• Makes the process less stressful• Easier to integrate audio (if headset)• Hands-free navigation (if headset)
Cons	<ul style="list-style-type: none">• Need internet and battery to use• Users may not want to download an app solely for finding restrooms• Hard to integrate audio for visually challenged people	<ul style="list-style-type: none">• Longer use times, not practical• Headset is not accessible to many potential users• Learning curve for mobile AR• Mobile AR requires more complex real-time data processing (data types other than location tracking)• Tasks can be completed without AR at much lower engineering task• Battery consumption

Appendix 3: Testing

Consent Forms: in shared Google Folder

Script:

Intro: "Thanks for joining! I'll briefly show how to interact with the prototype, like where buttons and scrolling work. As you test, please think aloud about your thoughts or any confusion. I'll guide you through each task, one at a time."

Demo: "Here's how you interact with buttons – you can tap to select!"

[Show basic interaction without performing any tasks.]

Task 1: Find a Nearby Accessible Restroom

Prompt: "Imagine you're looking for a [insert filter] restroom nearby. Find a restroom that meets your needs."

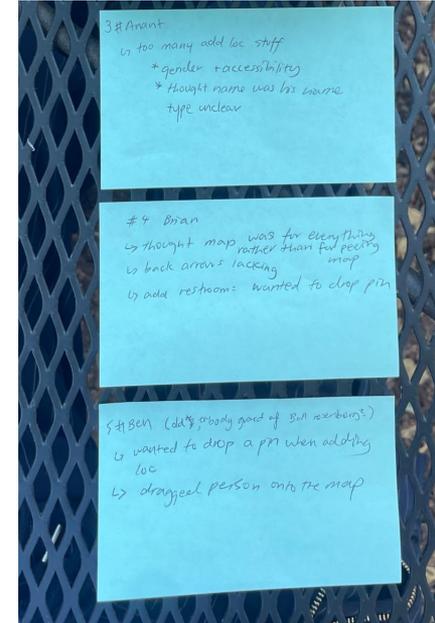

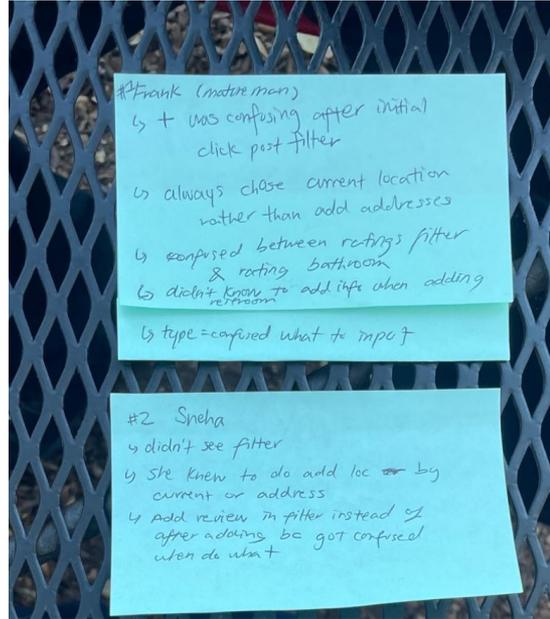

Task 2: Rate a Restroom

Prompt: "You've just used a restroom and want to leave a rating. Can you rate the restroom you visited?"

Task 3: Add a New Restroom

Prompt: "You've discovered a new restroom that isn't on the map. Can you add it to the app?"

Wrap-Up: "Thanks! Do you have any final thoughts or questions? Was anything confusing or unexpected?"

Appendix 4: Critical Incidents from Testing

Critical Incidents	Priority
General feedback / finding a restroom: <ul style="list-style-type: none">- One user thought the map was a general map rather than a restroom map- Users always chose “current location” rather than type in an address, but they see both	2 2
Rating and Filtering: <ul style="list-style-type: none">- Didn't see the Filter feature- Users are confused between the ratings in the filtering vs post-restroom evaluation	3 4
Adding a restroom: <ul style="list-style-type: none">- Initial + and ✓ after filling details is confusing- Too many details to add (e.g. What is “Type”?)- Thought “Name” was the user's name- Add review before or after successfully adding a restroom- Add restrooms by dropping pin (rather than current location or entering address)	4 3 2 3 3
