nautilus eye, wikipedia

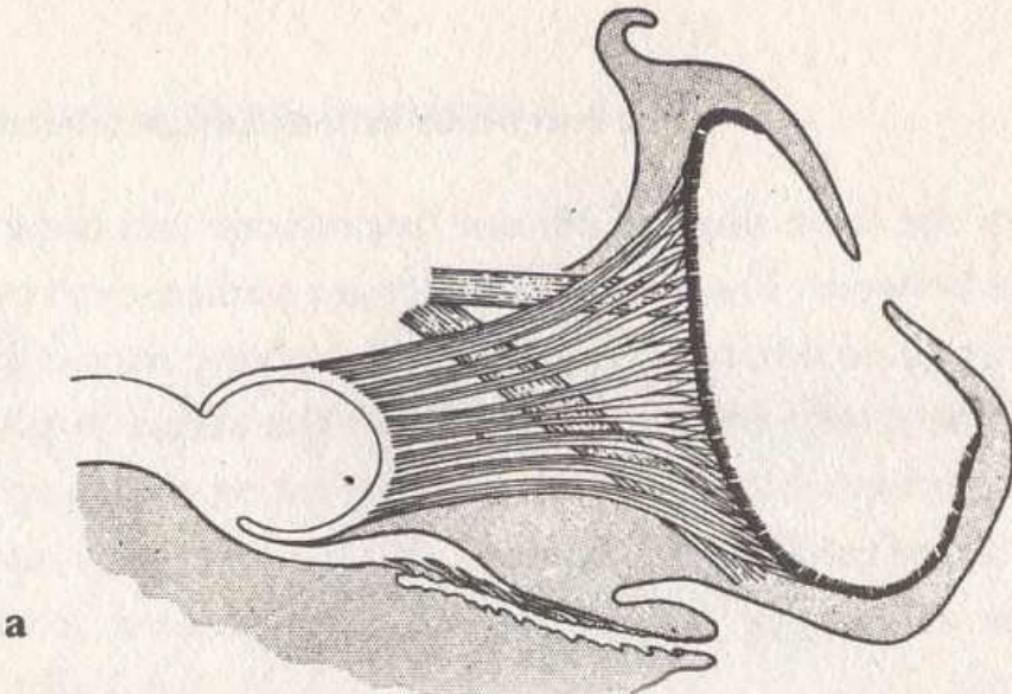

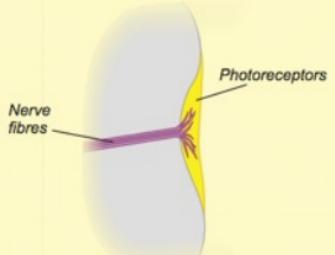

Figure 5.8 (opposite) A range of invertebrate eyes that illustrate approaches to the formation of crude but effective images: (a) *Nautilus*'s pinhole eye; (b) marine snail; (c) bivalve mollusc; (d) abalone; (e) ragworm.

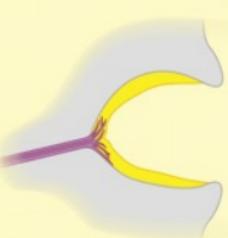

reptile eye, <http://pichost.me/16085580/>

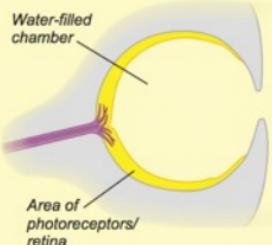

a) Region of photosensitive cells

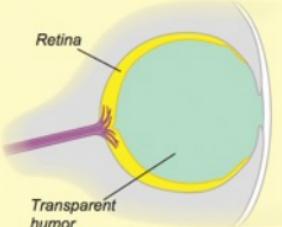

b) Depressed/folded area allows limited directional sensitivity

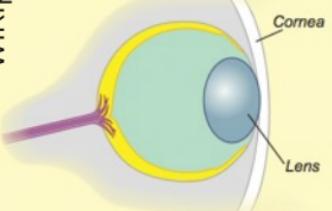

c) "Pinhole" eye allows finer directional sensitivity and limited imaging

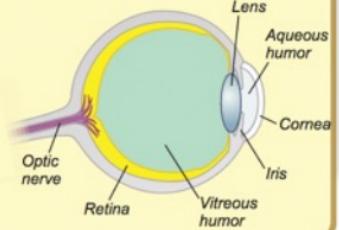

d) Transparent humor develops in enclosed chamber

e) Distinct lens develops

f) Iris and separate cornea develop

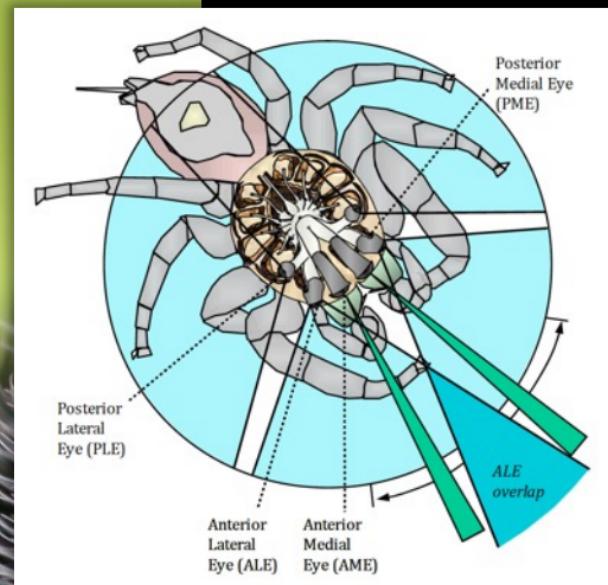

Evolution of the Eye

Lecture Overview

- **visual acuity:** 20/20 is ~ 1 arc min
- visual acuity varies over retina: can exploit via **foveated rendering**
- **visual field:** $\sim 200^\circ$ monocular, $\sim 120^\circ$ binocular, $\sim 135^\circ$ vertical
- **temporal resolution:** ~ 60 Hz (depends on contrast, luminance)
- **depth cues in 3D displays:** disparity, vergence, accommodation, blur, ...
- **accommodation range:** $\sim 8\text{cm}$ to ∞ , degrades with age

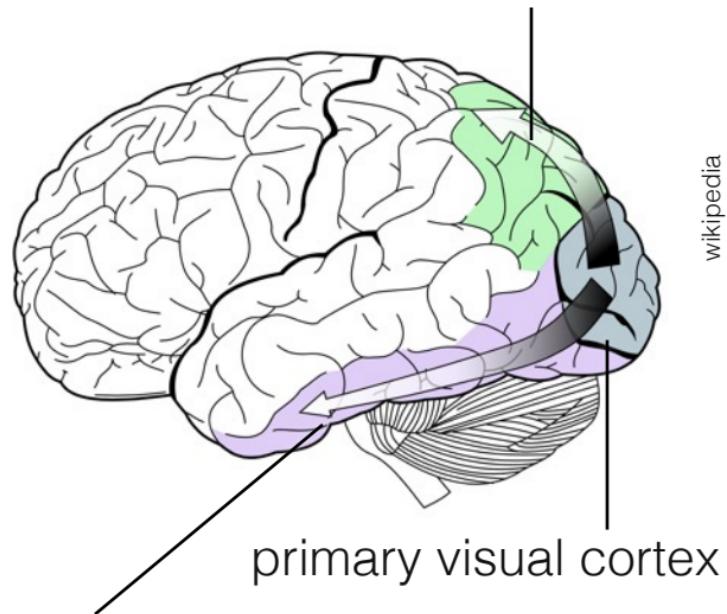

Overview

Overview

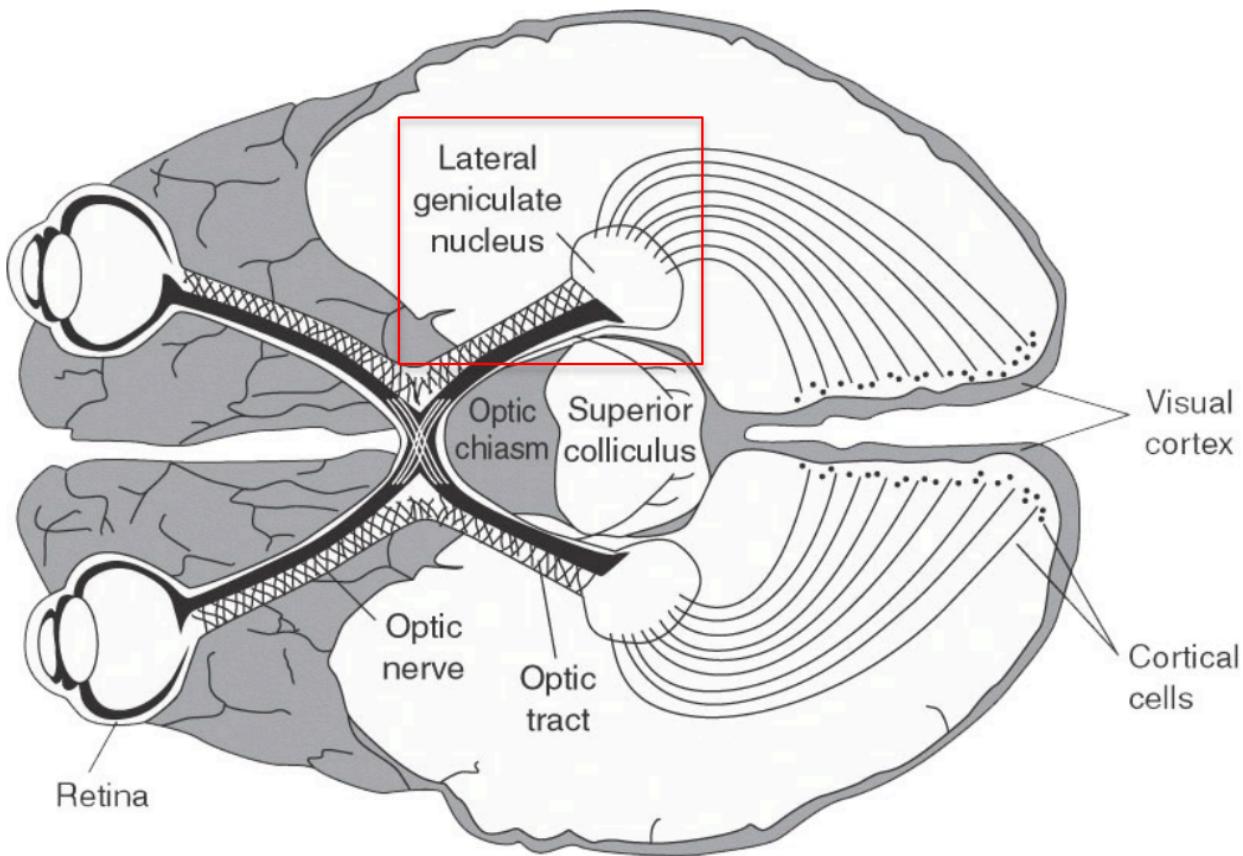

dorsal stream: spatial awareness

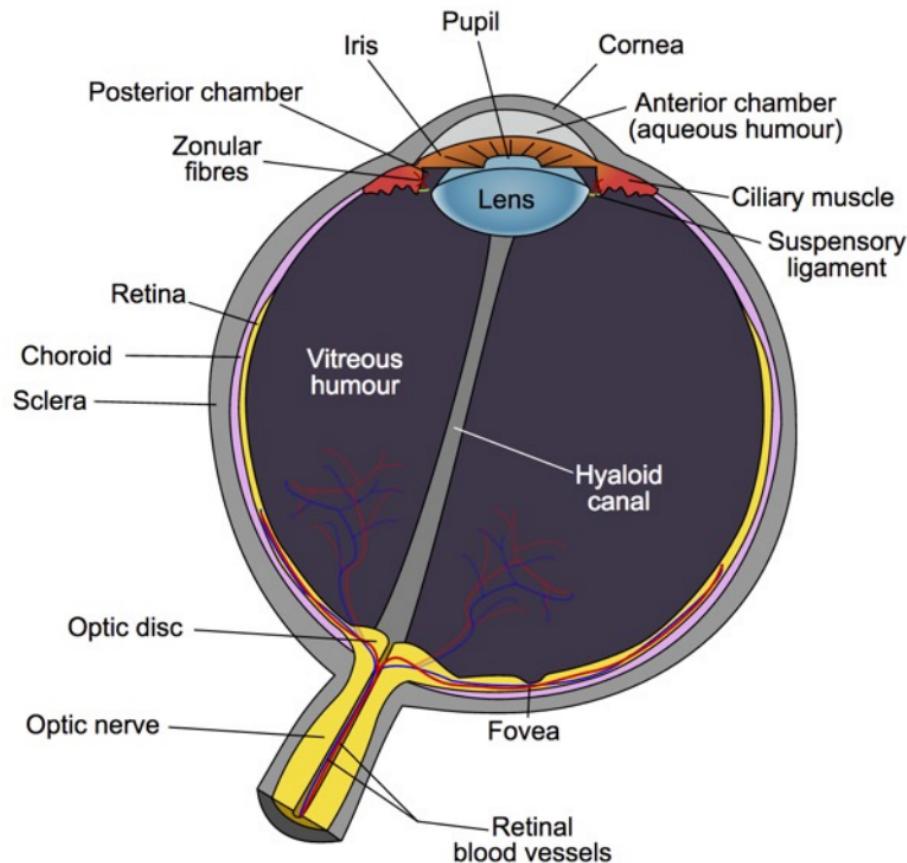

ventral stream:
recognition, object identification

Overview

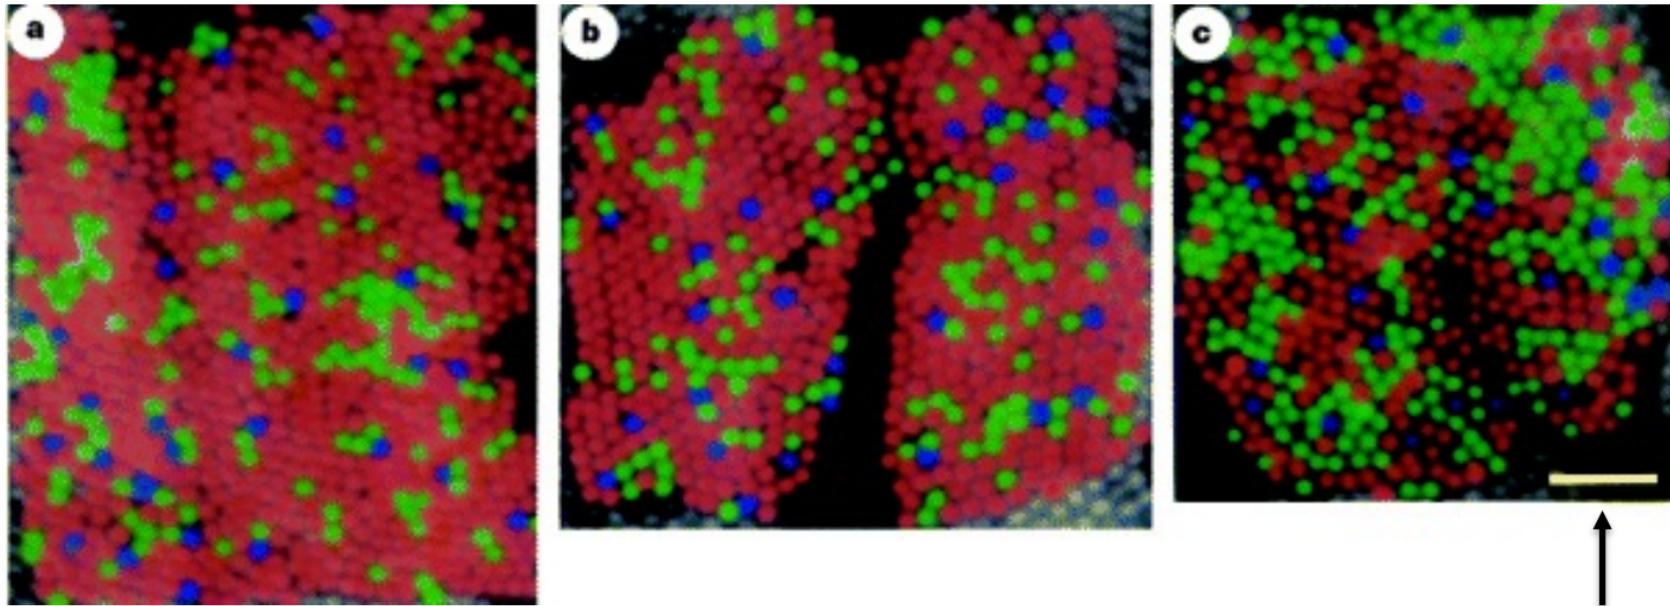

Anatomy of the Human Eye

The Retina

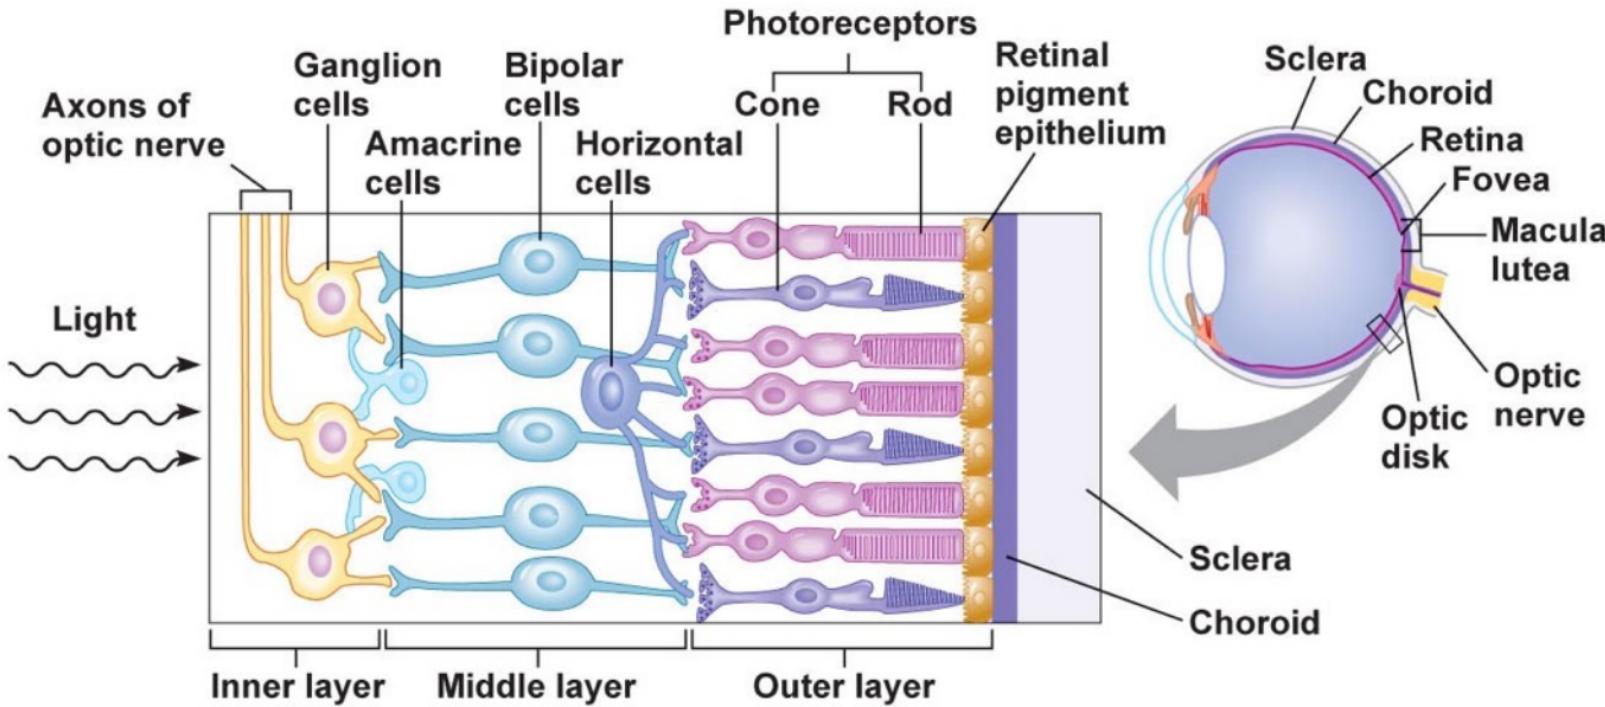

Roorda & Williams, 1999, Nature

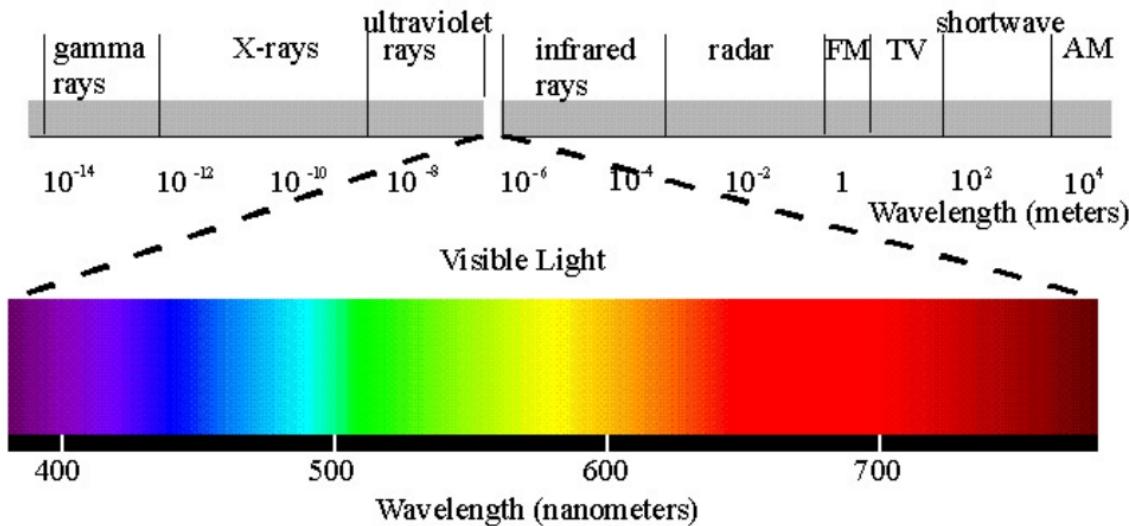

5 arcmin visual angle

photoreceptors: 3 types of cones (color vision), rods (luminance only, night vision)

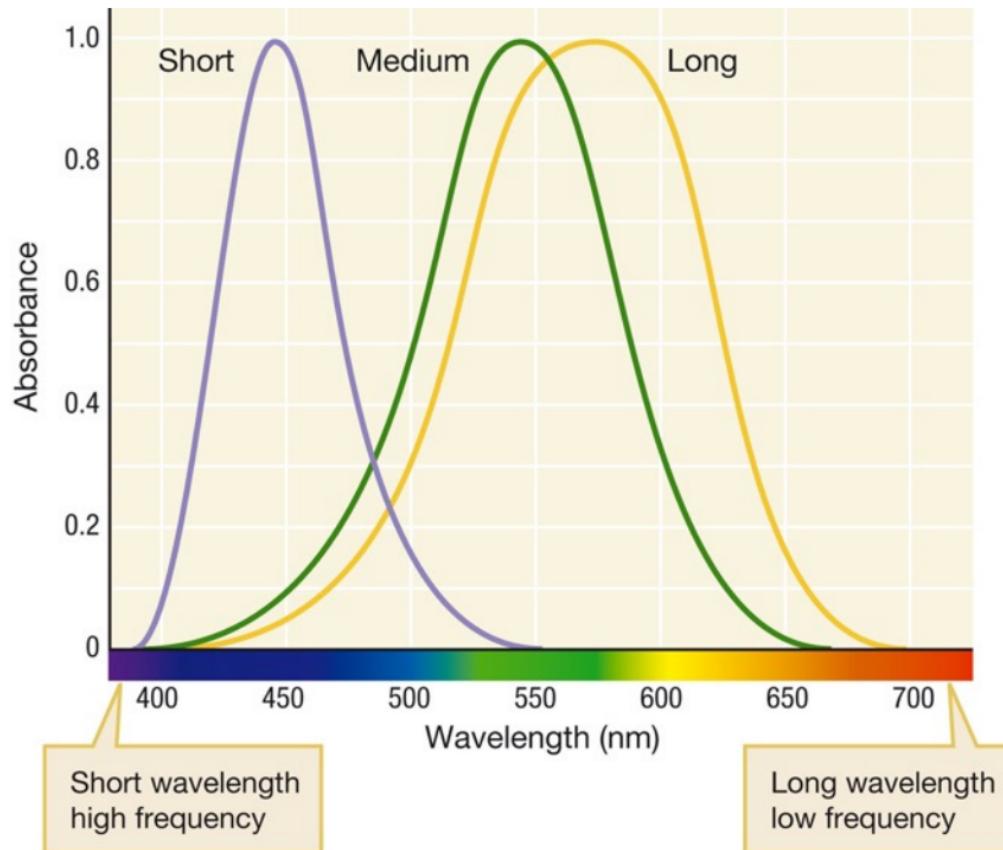

The Retina

Color Perception

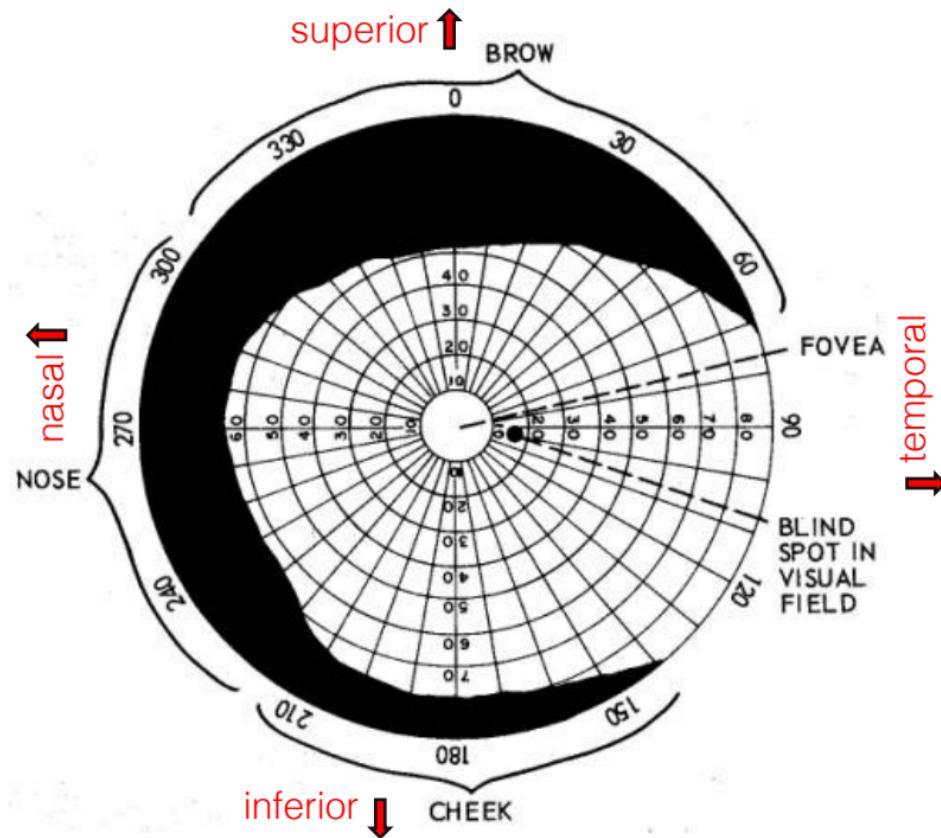

Color Perception - Sensitivity of Cones

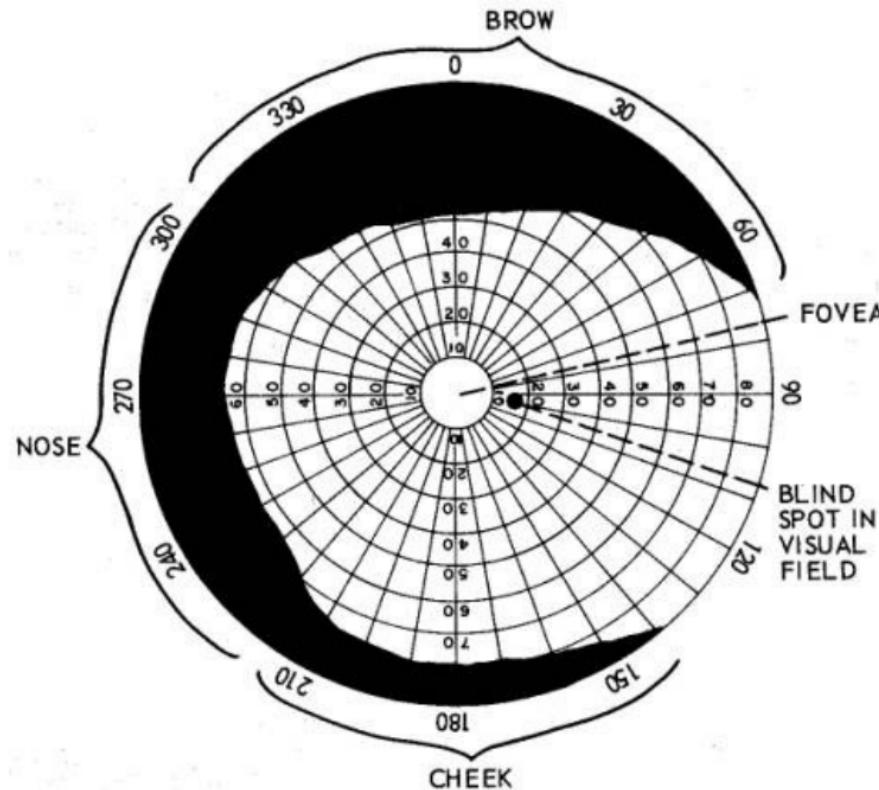

Visual Field

Ruch & Fulton, 1960

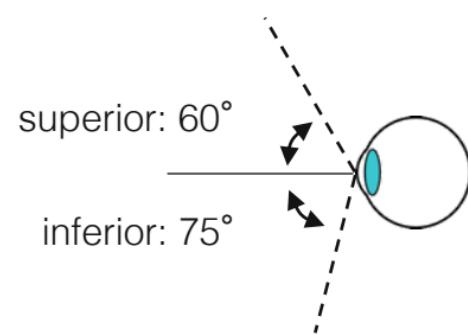

monocular visual field of right eye

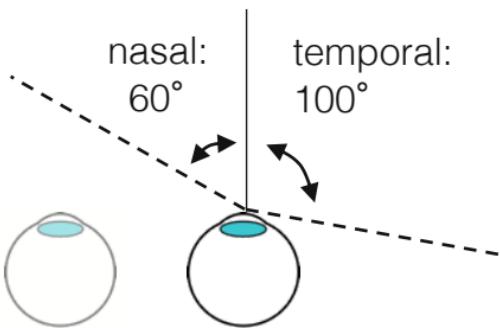

monocular visual field of right eye

Visual Field

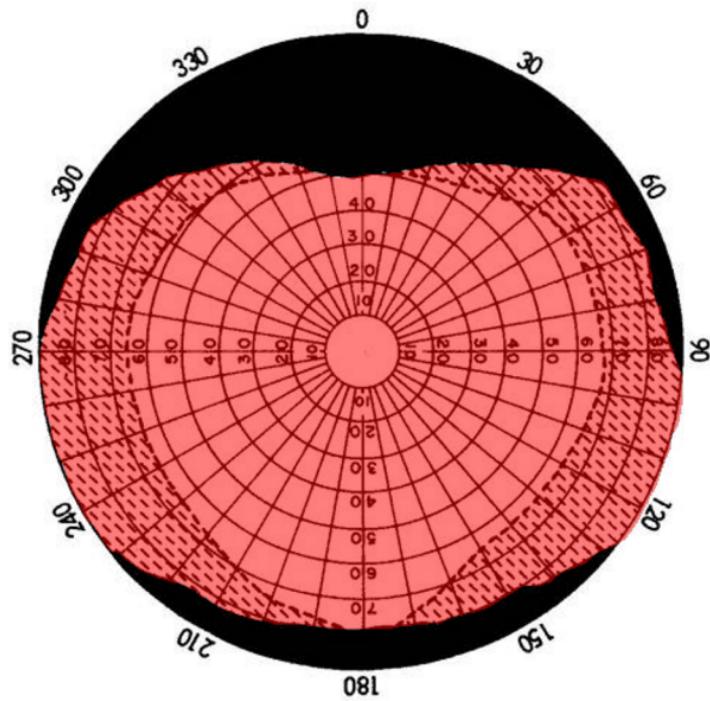

vertical (superior / inferior directions)

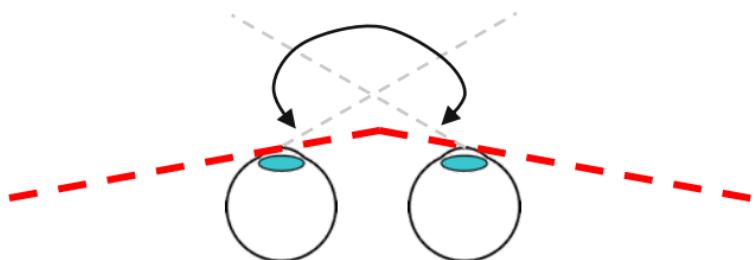

horizontal (nasal / temporal directions)

Visual Field

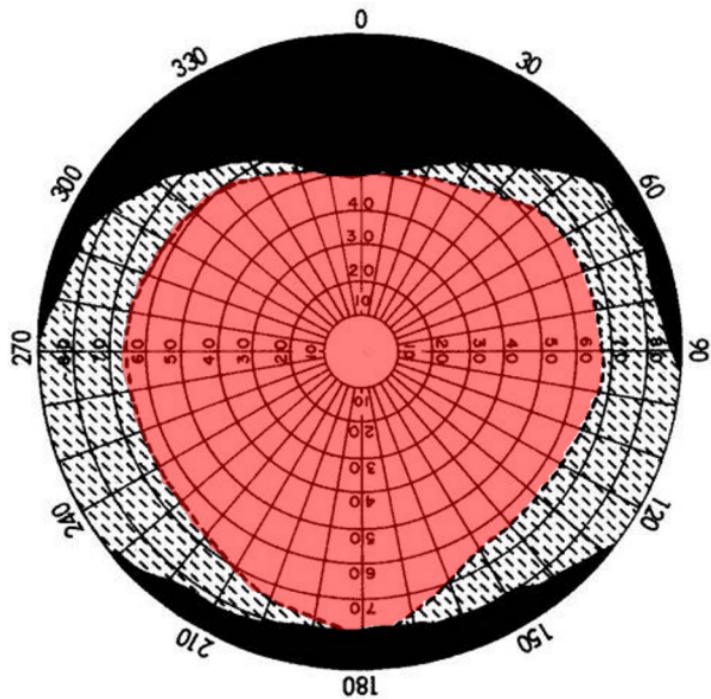

visual field of both eyes

temporal left + temporal right: 200°

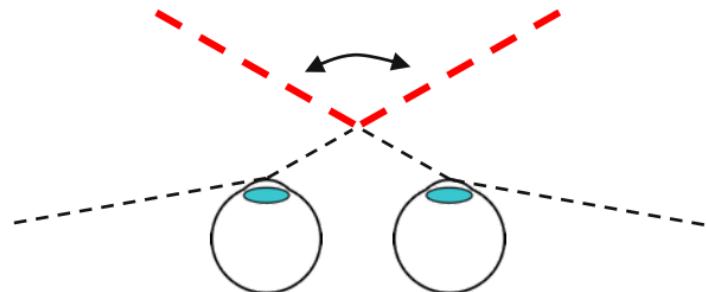

total visual field of both eyes

Visual Field

visual field of both eyes

nasal left + nasal right: 120°

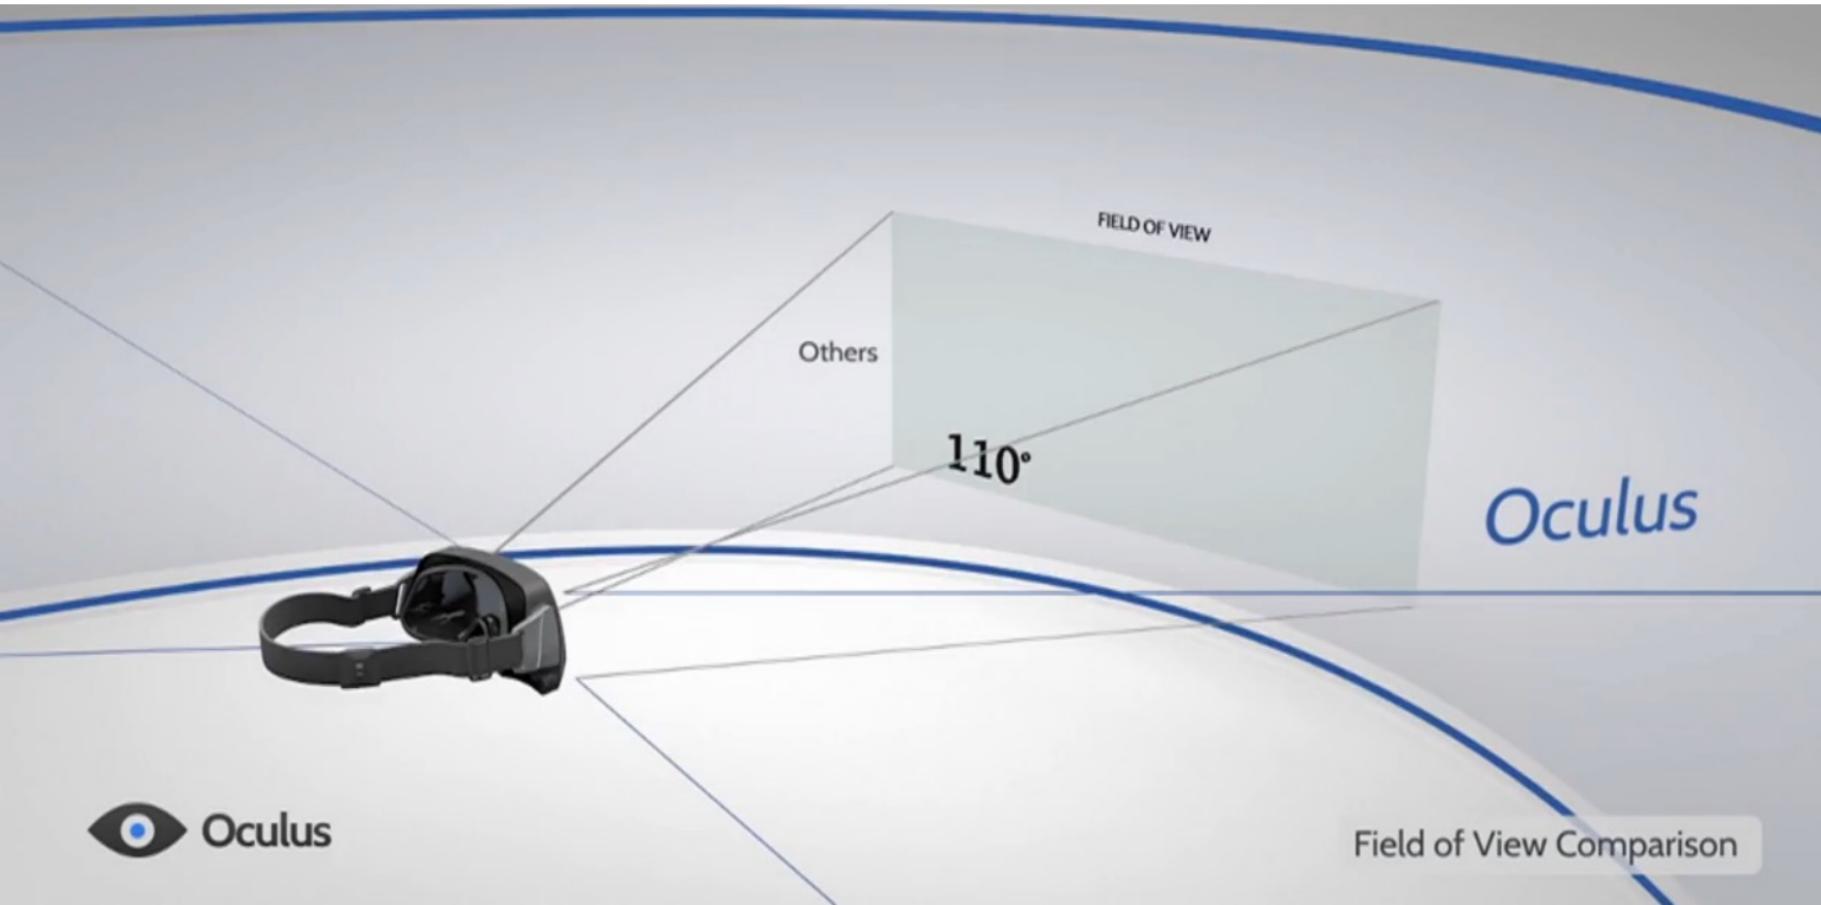

binocular visual field or
region of binocular overlap
→ stereo vision

Visual Field - Terminology

- monocular visual field: visual field of either only the left or right eye
- binocular visual field or region of binocular overlap: intersection of monocular visual fields, i.e. only the overlapping part of both eyes – this is where we see stereo!
- total visual field: union of monocular visual fields, i.e. visual fields of both eyes combined – not all of this is stereo, temporal peripheries are mono!

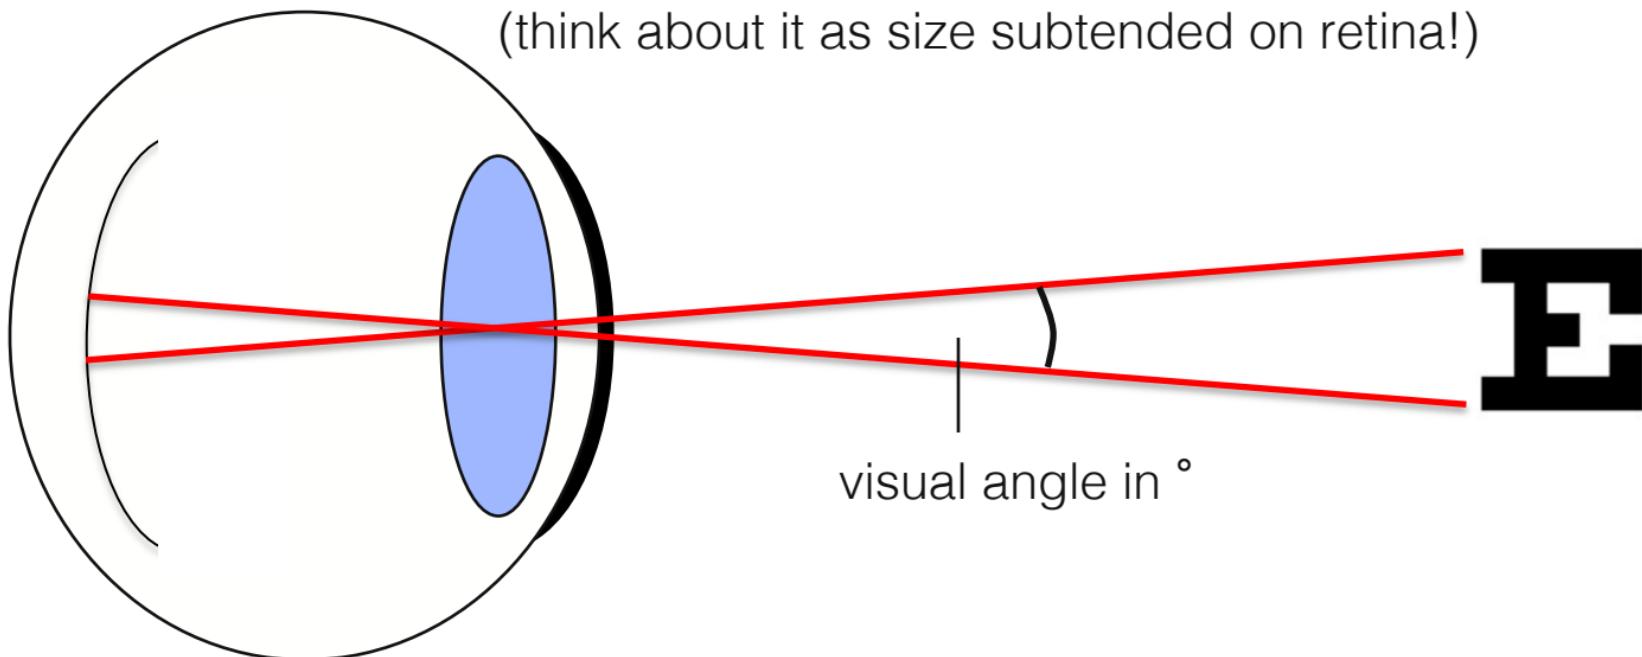

Immersive VR – How Important is the FOV?

Field of View Comparison

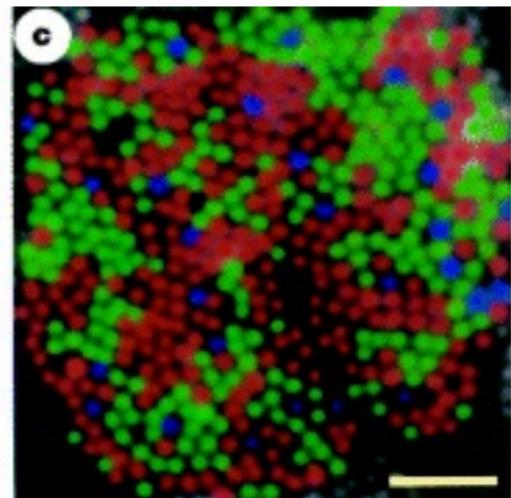

Visual Angle

- vision scientists often measure size in visual angle
- visual angle \approx object size / object distance in degree
(think about it as size subtended on retina!)

Visual Acuity

each photoreceptor
~ 1 arc min (1/60 of a degree)
of visual angle

5 arcmin visual angle

Visual Acuity

8 20/20

9

10

11

characters are 5 arc min of visual angle, need to resolve 1 arc min to read

Retina VR Display – What does it Take?

need per eye:

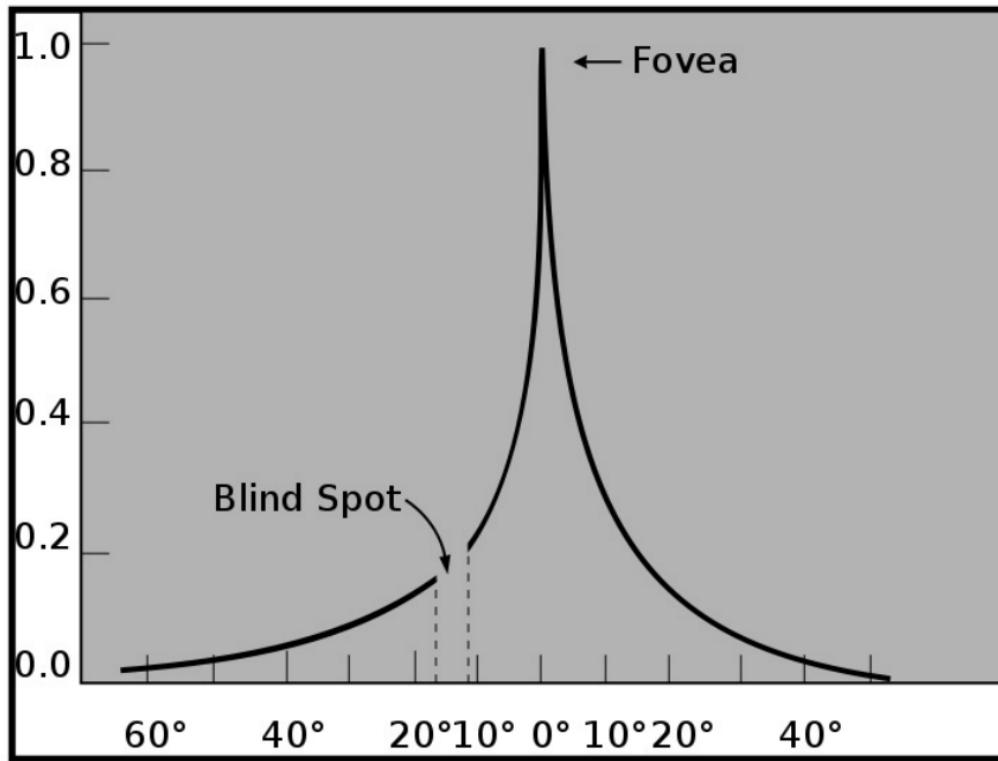

150° x 135° with pixels covering 1 arc min of visual angle
= 9000 x 8100 pixels (probably 2-3x of that in practice)

biggest challenge: bandwidth

- capture or render stereo panoramas or images at that resolution
- compress and transmit huge amount of data
- drive and operate display pixels

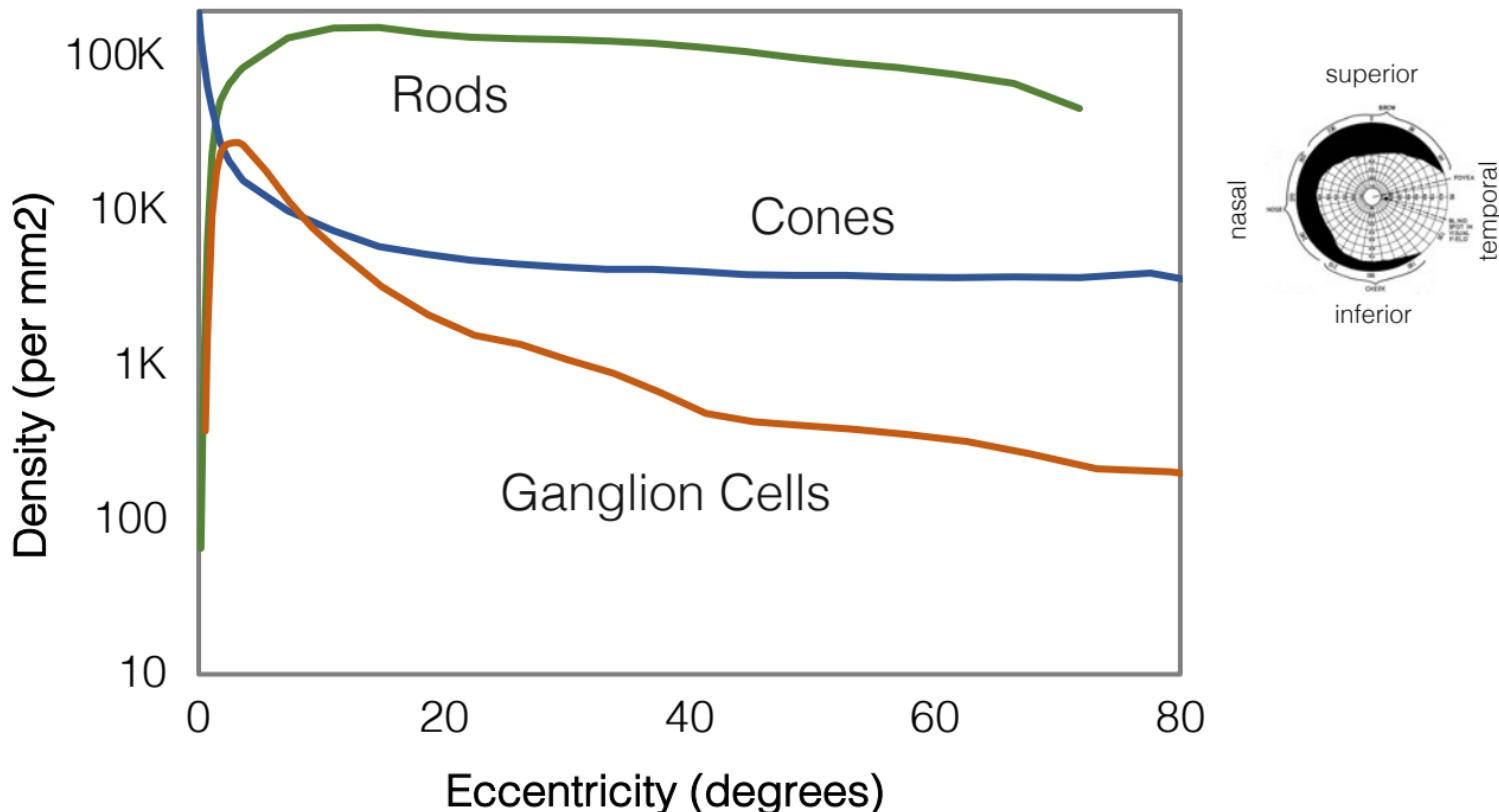

Relative Acuity Over Retina

wikipedia

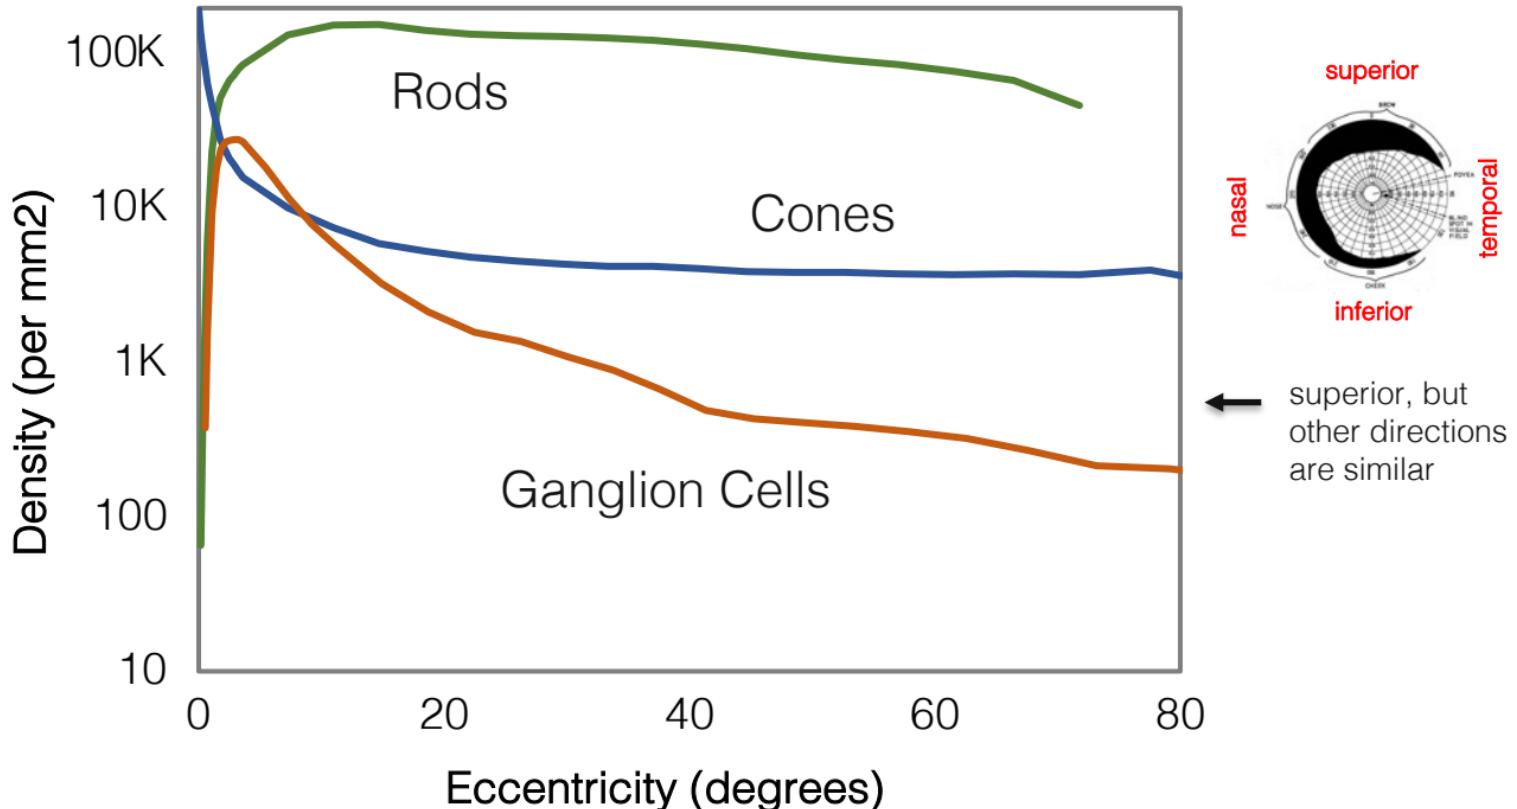

Eccentricity (i.e., distance to fovea in degrees of visual angle)

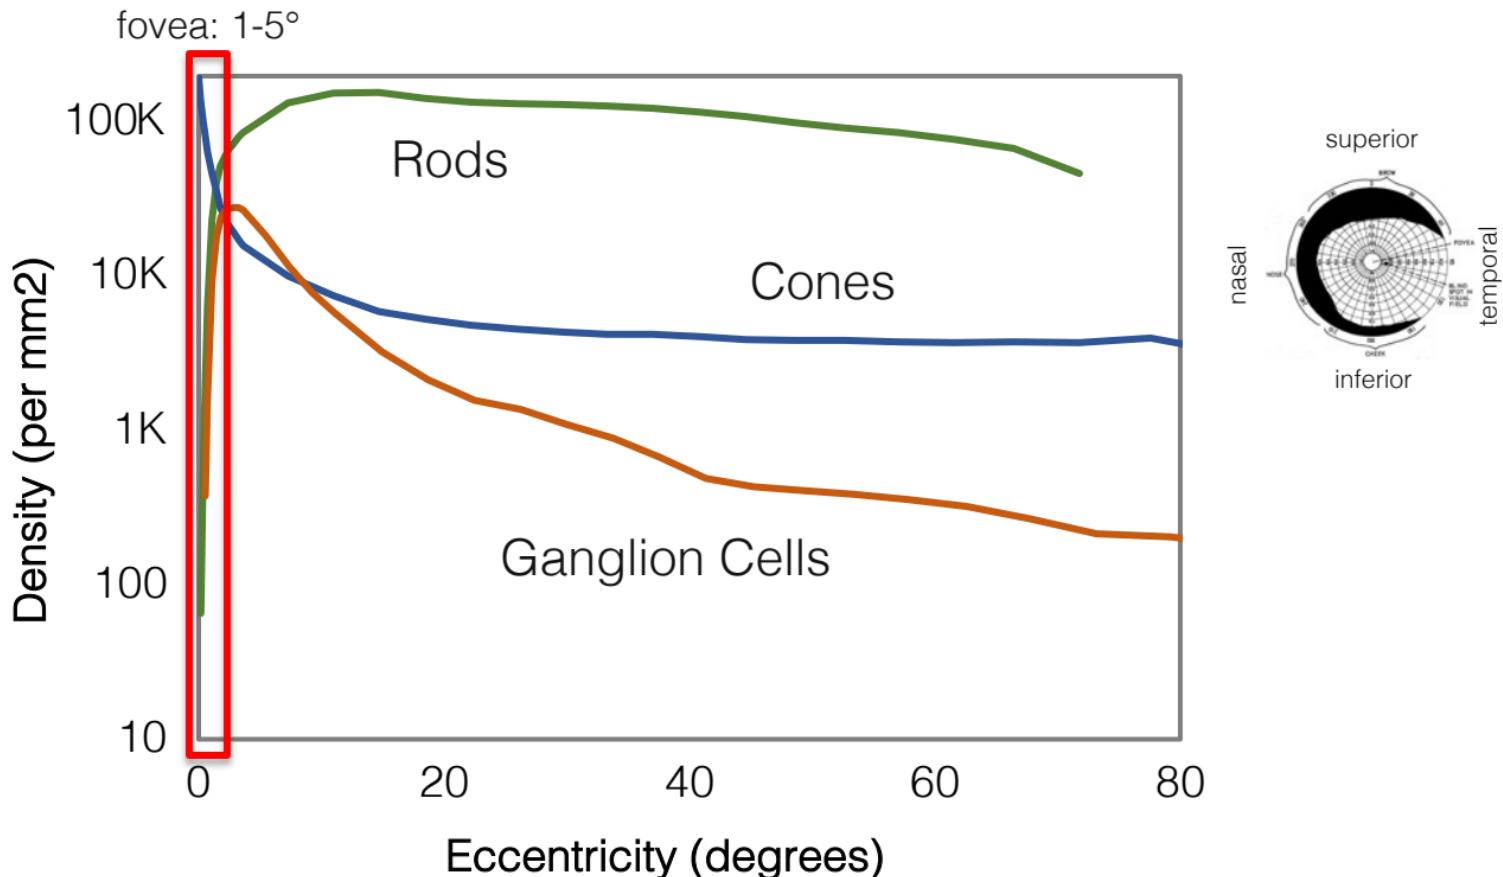

Density of Photoreceptors on Retina

Density of Photoreceptors on Retina

Density of Photoreceptors on Retina

Acuity Over Retina / MAR

acuity falls off due to:

- reduced receptor and ganglion cell density
- reduced optical nerve “bandwidth”
- reduced “processing” devoted to periphery in the visual cortex

Acuity Over Retina / MAR

acuity falls off due to:

- reduced receptor and ganglion cell density
- reduced optical nerve “bandwidth”
- reduced “processing” devoted to periphery in the visual cortex

MAR: minimum angle of
resolution in deg/cycle slope

$$\omega = me + \omega_0$$

↑ ↑
eccentricity in degrees smallest resolvable angle at fovea in deg/cycle

Acuity Over Retina / MAR

acuity falls off due to:

- reduced receptor and ganglion cell density
- reduced optical nerve “bandwidth”
- reduced “processing” devoted to periphery in the visual cortex

MAR: minimum angle of
resolution in deg/cycle slope

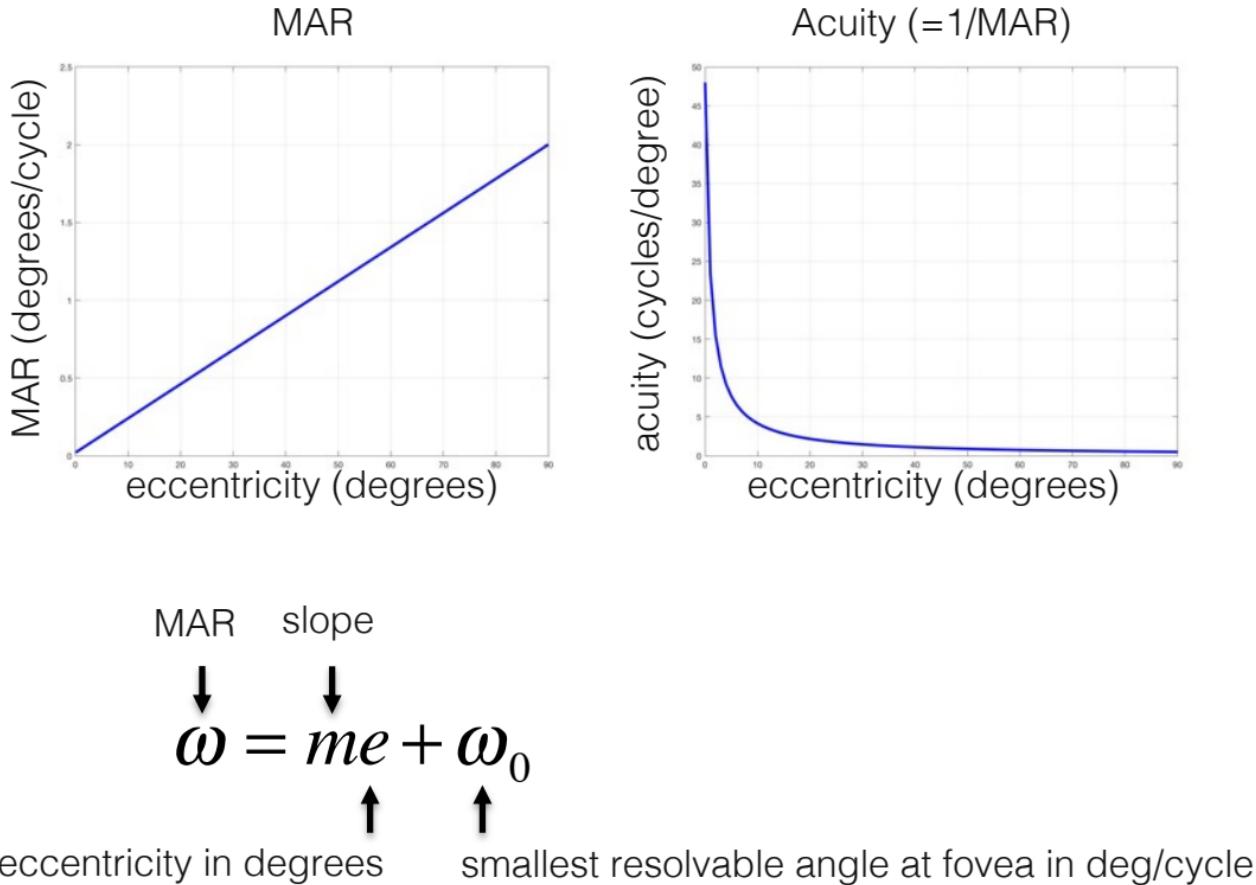

$$\omega_0 = (1/48)^\circ \quad \text{somewhere between 20/20 (30 cycles per degree) and 20/10 (60 cycles per degree)}$$

$$\omega = me + \omega_0$$

↓ ↓
eccentricity in degrees smallest resolvable angle at fovea in deg/cycle

$$m = 0.022 - 0.034 \quad \text{range of acceptable – equivalent for observed image quality}$$

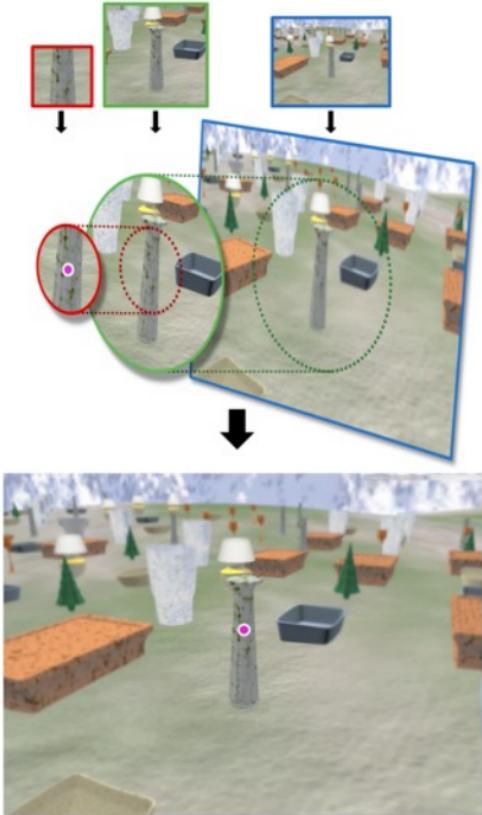

Acuity Over Retina / MAR

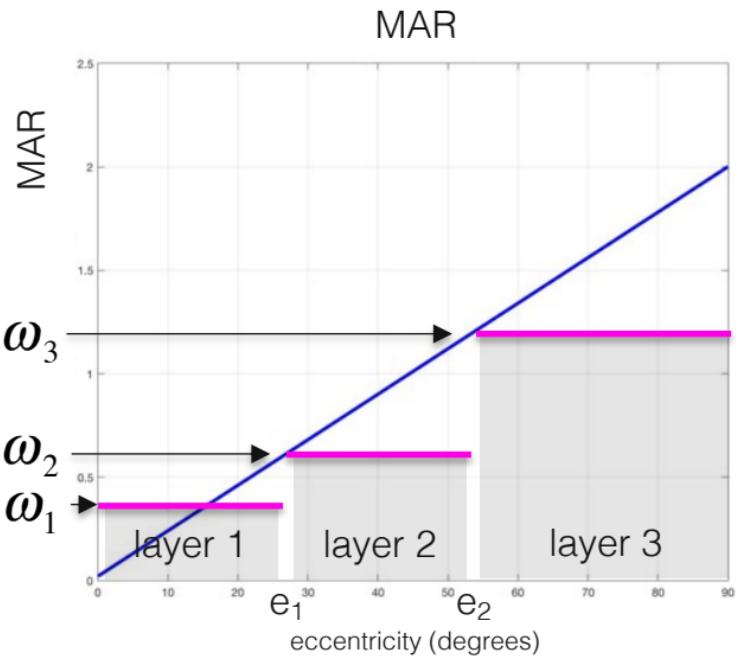

Foveated Rendering

- Guenter et al. 2012: split image into n layers, e.g. inner (foveal, 1), middle (2), outer (3)
- render image in each zone with progressively lower resolution
- goals: save computation & bandwidth!

Foveated Rendering

- Guenter et al. 2012: split image into n layers, e.g. inner (foveal, 1), middle (2), outer (3)

$$e_i = \frac{i}{n} \cdot \frac{fov}{2}$$

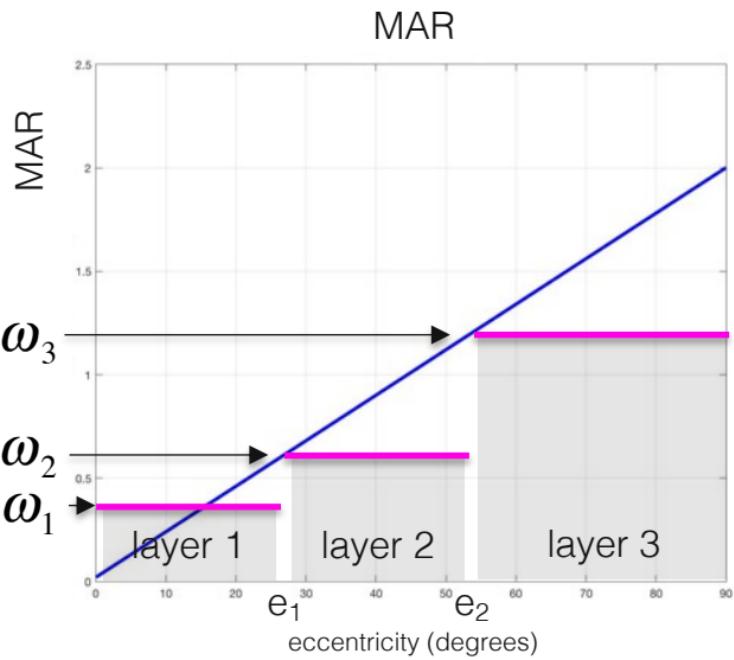

➡

$$e_1 = \frac{fov}{6}$$
$$e_2 = \frac{fov}{3}$$

Foveated Rendering

ω_1 is best the display can do!

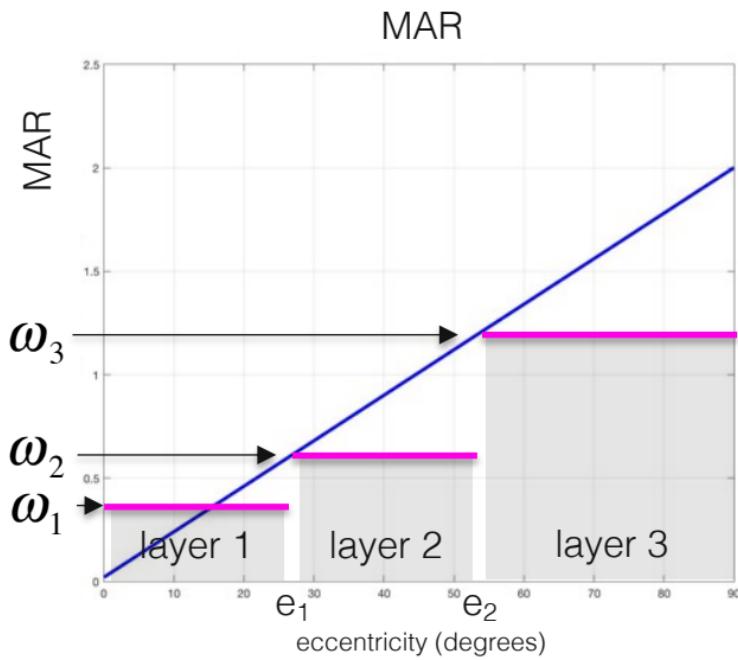

$$\text{unit of } \omega_1: \frac{\text{degrees}}{\text{cycle}} = \frac{\text{degrees}}{2 \cdot \text{pixel_size}}$$

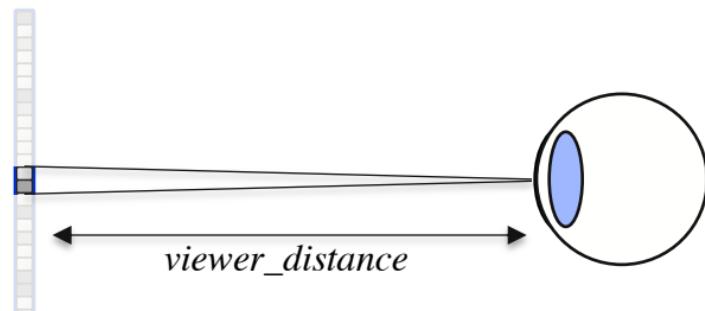

Foveated Rendering

ω_1 is best the display can do!

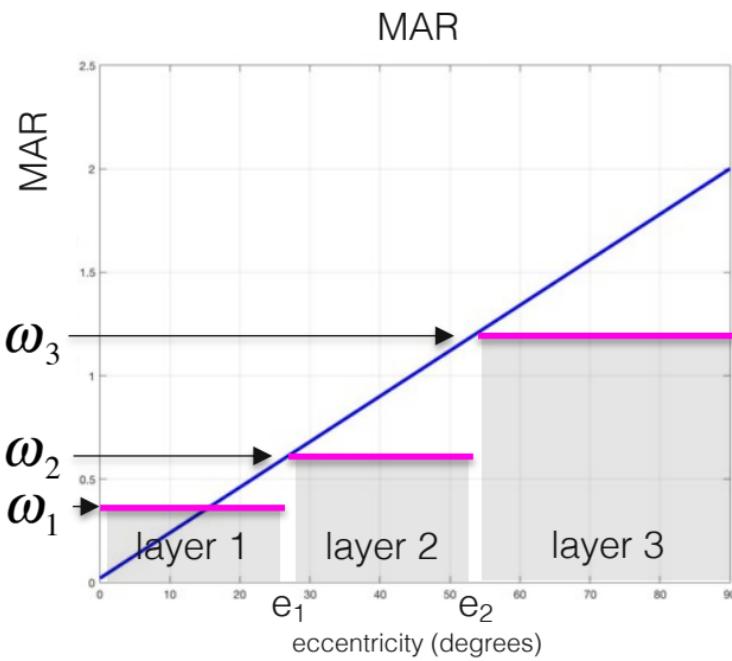

unit of ω_1 : $\frac{\text{degrees}}{\text{cycle}} = \frac{\text{degrees}}{2 \cdot \text{pixel_size}}$

$$\omega_1 = 2 \tan^{-1} \left(\frac{\text{screen_size}}{\text{screen_resolution} \cdot \text{viewer_distance}} \right) \cdot \frac{360}{2\pi}$$

Foveated Rendering

ω_1 is best the display can do!

unit of ω_1 : $\frac{\text{degrees}}{\text{cycle}} = \frac{\text{degrees}}{2 \cdot \text{pixel_size}}$

$$\omega_1 = 2 \tan^{-1} \left(\frac{\text{screen_size}}{\text{screen_resolution} \cdot \text{viewer_distance}} \right) \cdot \frac{360}{2\pi}$$

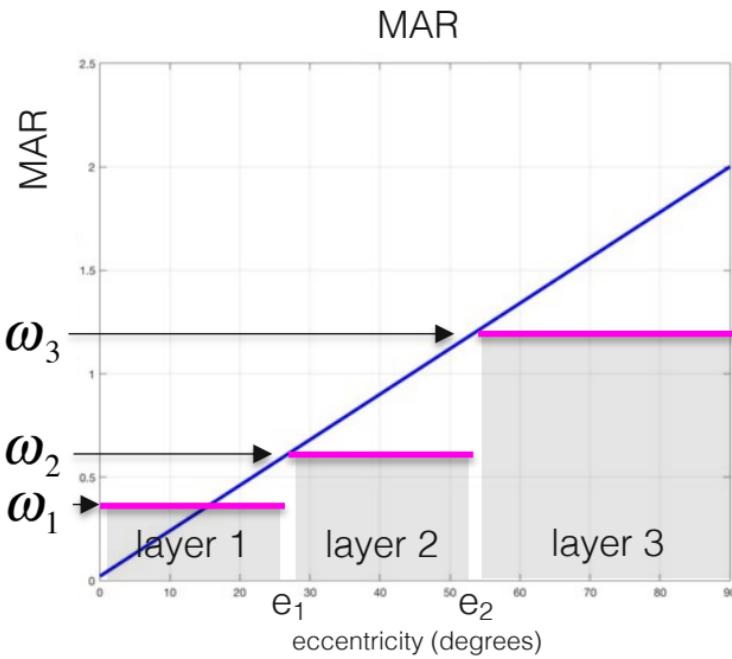

screen_size

is *either* screen width *or* height (same units as viewer_distance)

screen_resolution

is *either* number of horizontal pixels *or* vertical pixels of the screen (same dimension as screen_size)

Foveated Rendering

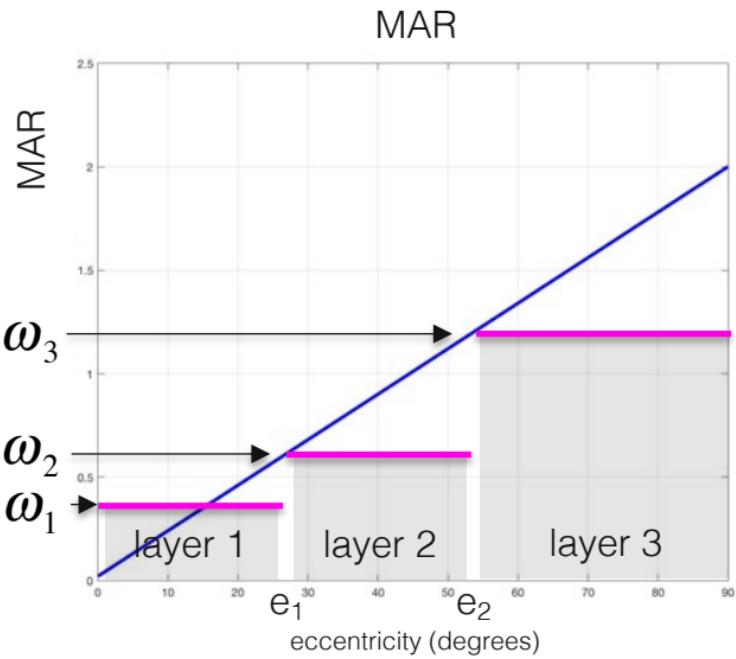

$$\omega_1 = 2 \tan^{-1} \left(\frac{\text{screen_size}}{\text{screen_resolution} \cdot \text{viewer_distance}} \right) \cdot \frac{360}{2\pi}$$

$$\omega_2 = m e_2 + \omega_0$$

$$\omega_3 = m e_3 + \omega_0$$

Foveated Rendering

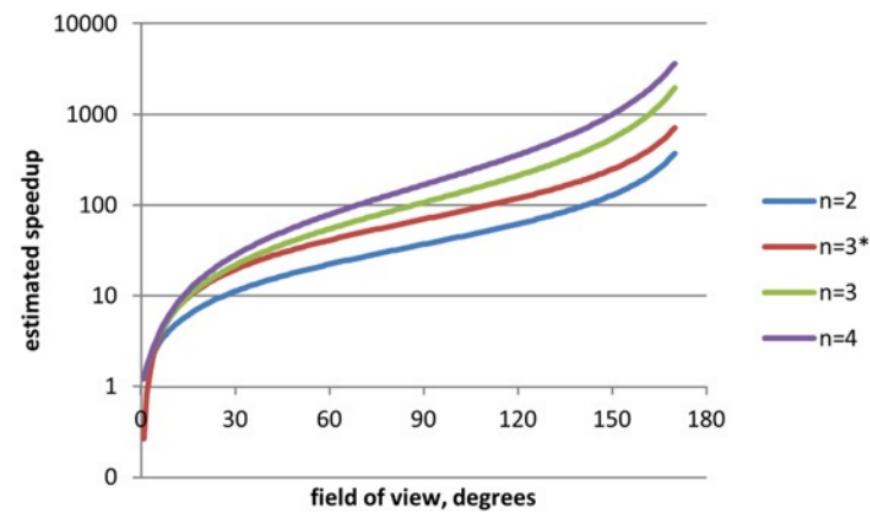

- convert MAR (in degrees/cycle) to pixels

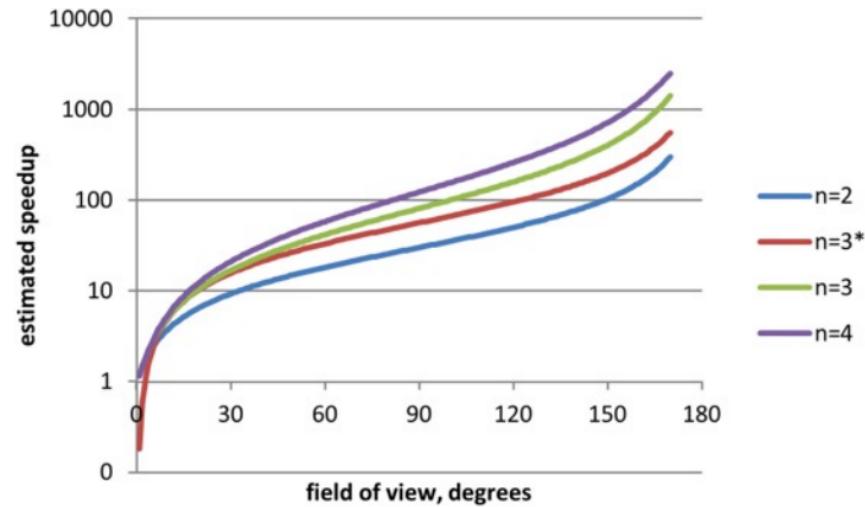

$$\text{blur_radius_in_px} = \text{viewer_distance} \cdot \tan\left(\frac{\omega}{2} \cdot \frac{2\pi}{360}\right)$$

Foveated Rendering – Performance Gain

$$m = 0.028$$

$$m = 0.022$$

n is number of layers

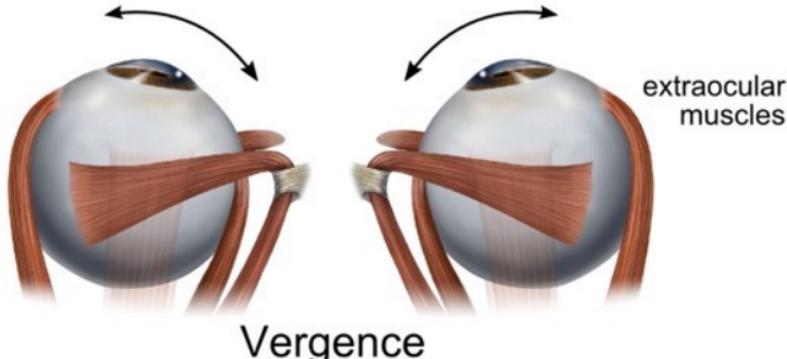

speedup is total number of display pixels / number of pixels in all layers combined

conclusion: for large fov & high-res displays, we need to shade much fewer pixels!
