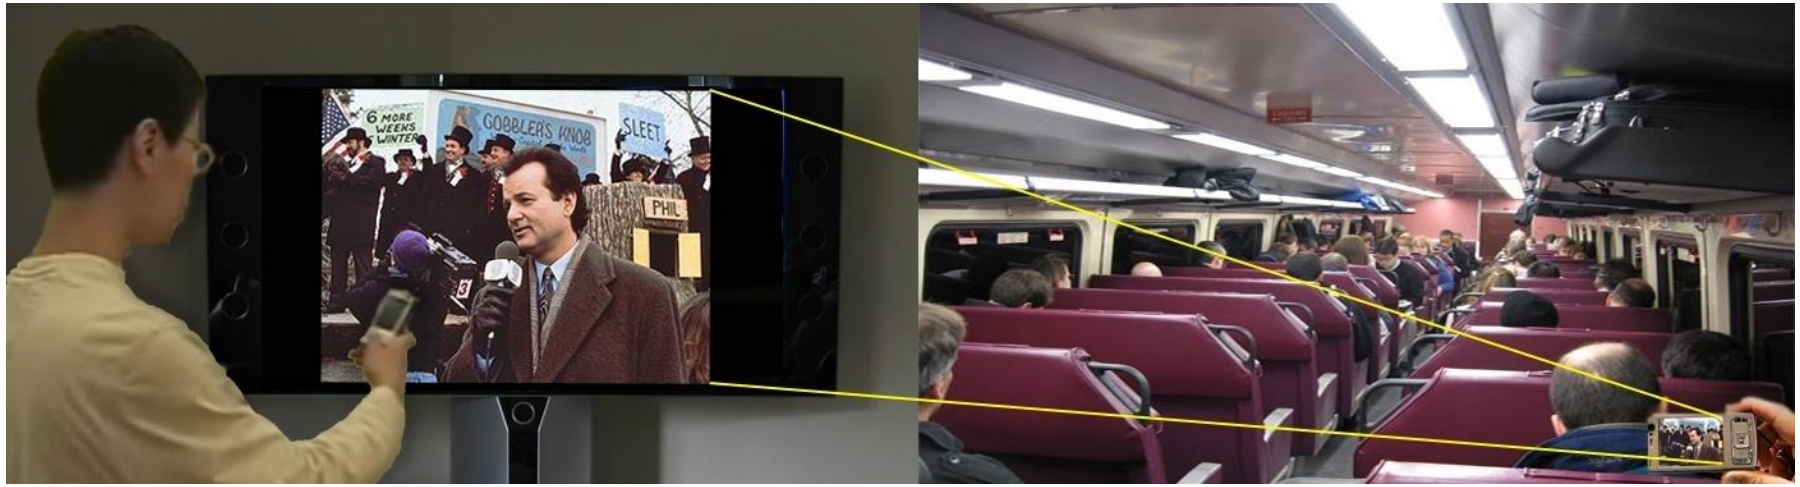
Recognizing video at a glance



(1) User snaps a photo of screen.

(3) User resumes video on the phone.

(2) Our system identifies video and frame within the video.

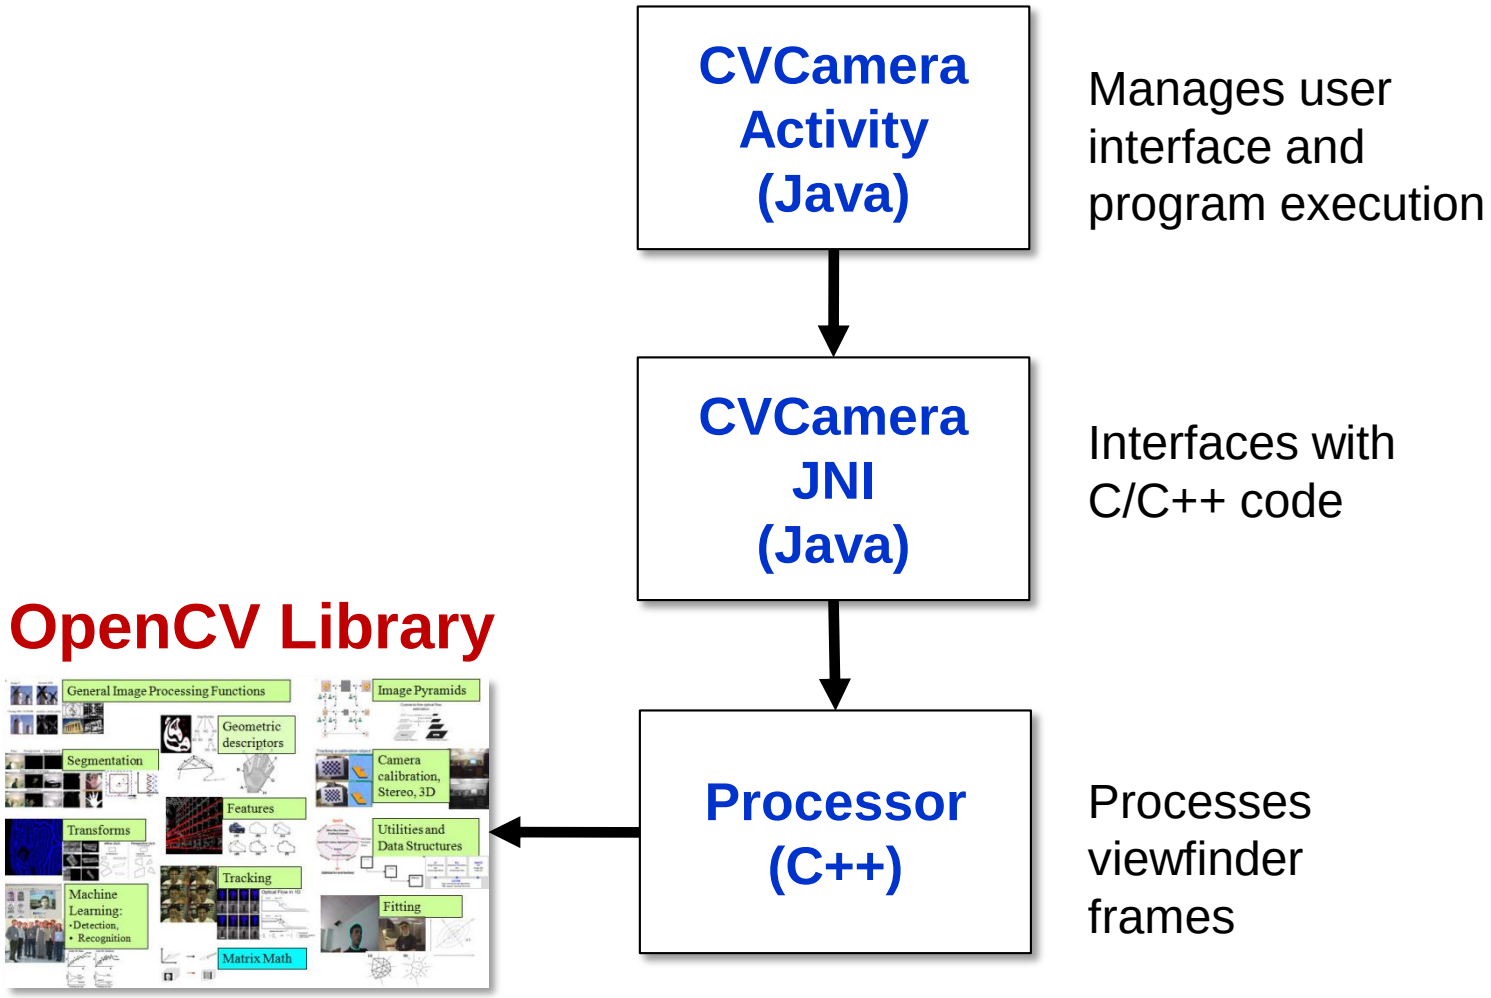
OpenCV for Android

- Port of OpenCV to Android platform
  - Over 2,500 optimized algorithms written in C/C++
  - Compiled with STL-enabled Android NDK
  - Enables popular CV functions to be used on mobile images/videos
- Differences from regular Android programming
  - Requires writing C/C++ code
  - Requires writing Java Native Interface (JNI) wrappers
  - Requires using Android NDK in addition to Android SDK
- Our Tutorial #2 helps to make the transition
  - How to set up OpenCV programming environment
  - How to write Android apps that call OpenCV functions
  - How to integrate NDK compilation into Eclipse IDE

“CVCamera” project

- Goals of this project
  - Learn how to incorporate C/C++ code into an Android project
  - Learn how to utilize OpenCV library functions
  - Learn how to draw feature keypoints on viewfinder frames
- Full source available on class website

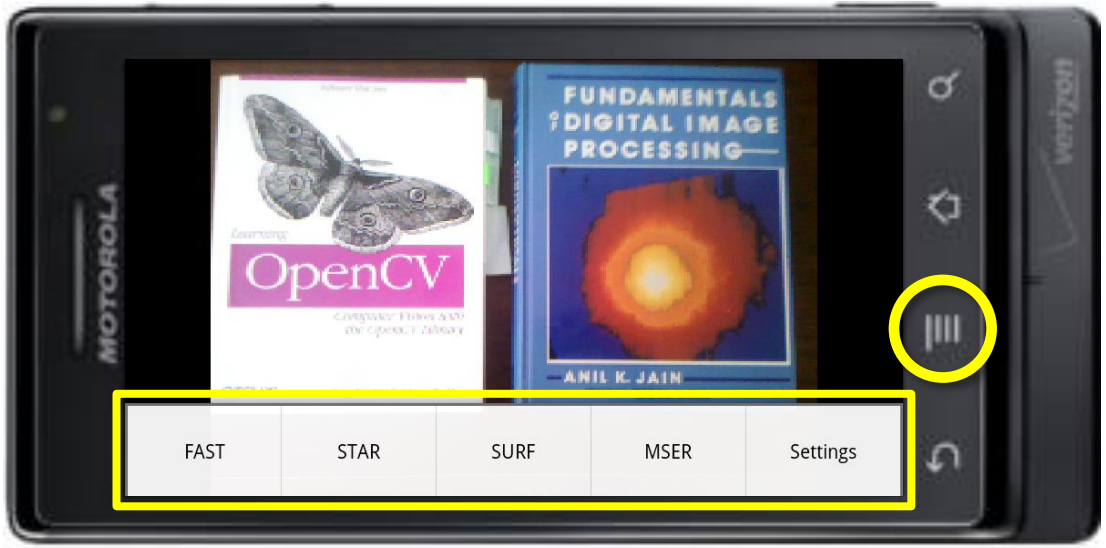
“CVCamera” class hierarchy



CVCamera class: menu options

```
public boolean onCreateOptionsMenu(Menu menu) {
    menu.add("FAST");
    menu.add("STAR");
    menu.add("SURF");
    menu.add("MSER");
    menu.add("Settings");
    return true;
}
```

Java Code



CVCamera class: calling feature extractors

```
public boolean onOptionsItemSelected(MenuItem item) {
   LinkedList<PoolCallback> defaultCallbackStack =
         new LinkedList<PoolCallback>();

   defaultCallbackStack.addFirst(myGLView.getDrawCallback());

   if (item.getTitle().equals("FAST")) {
         defaultCallbackStack.addFirst(new FastProcessor());
   }
   else if (item.getTitle().equals("STAR")) {
         defaultCallbackStack.addFirst(new STARProcessor());
   }
   else if (item.getTitle().equals("SURF")) {
         defaultCallbackStack.addFirst(new SURFProcessor());
   }
   else if (item.getTitle().equals("MSER")) {
         defaultCallbackStack.addFirst(new MSERProcessor());
   }

   myPreview.addCallbackStack(defaultCallbackStack);
   return true;
}
```

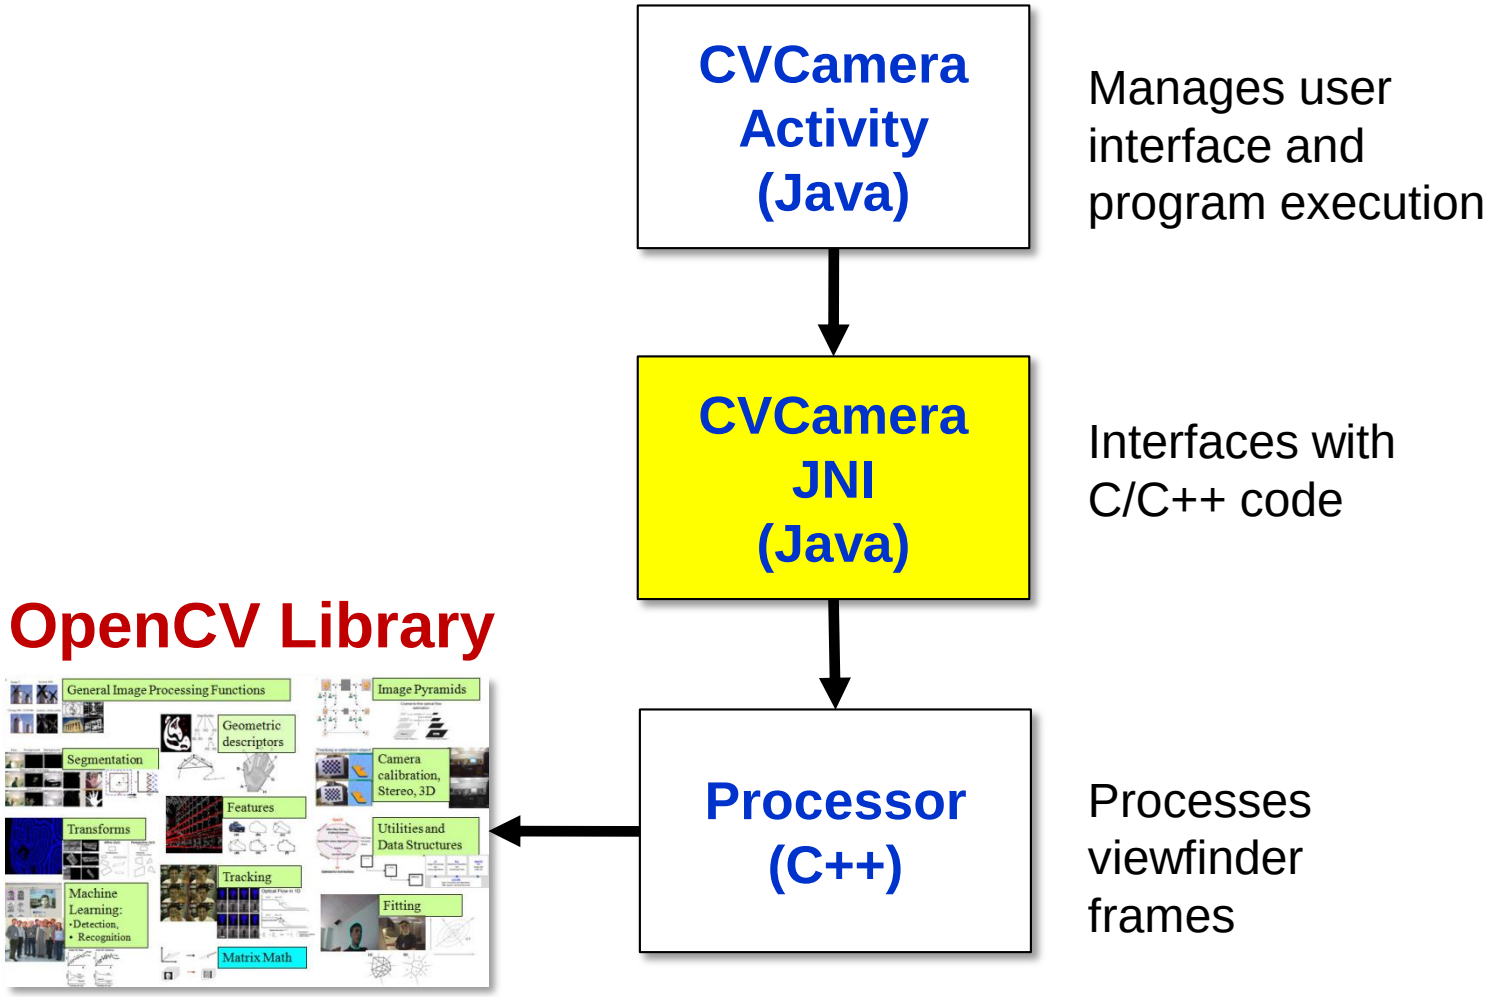
Java Code

Populate a stack of callback functions

First callback function draws the frames

Other callback functions call feature extractors

“CVCamera” class hierarchy



JNI class: interface to C/C++ code

```
static {
   try {
         System.loadLibrary("android-opencv");
         System.loadLibrary("cvcamera");
   } catch (UnsatisfiedLinkError e) {
         throw e;
   }
}

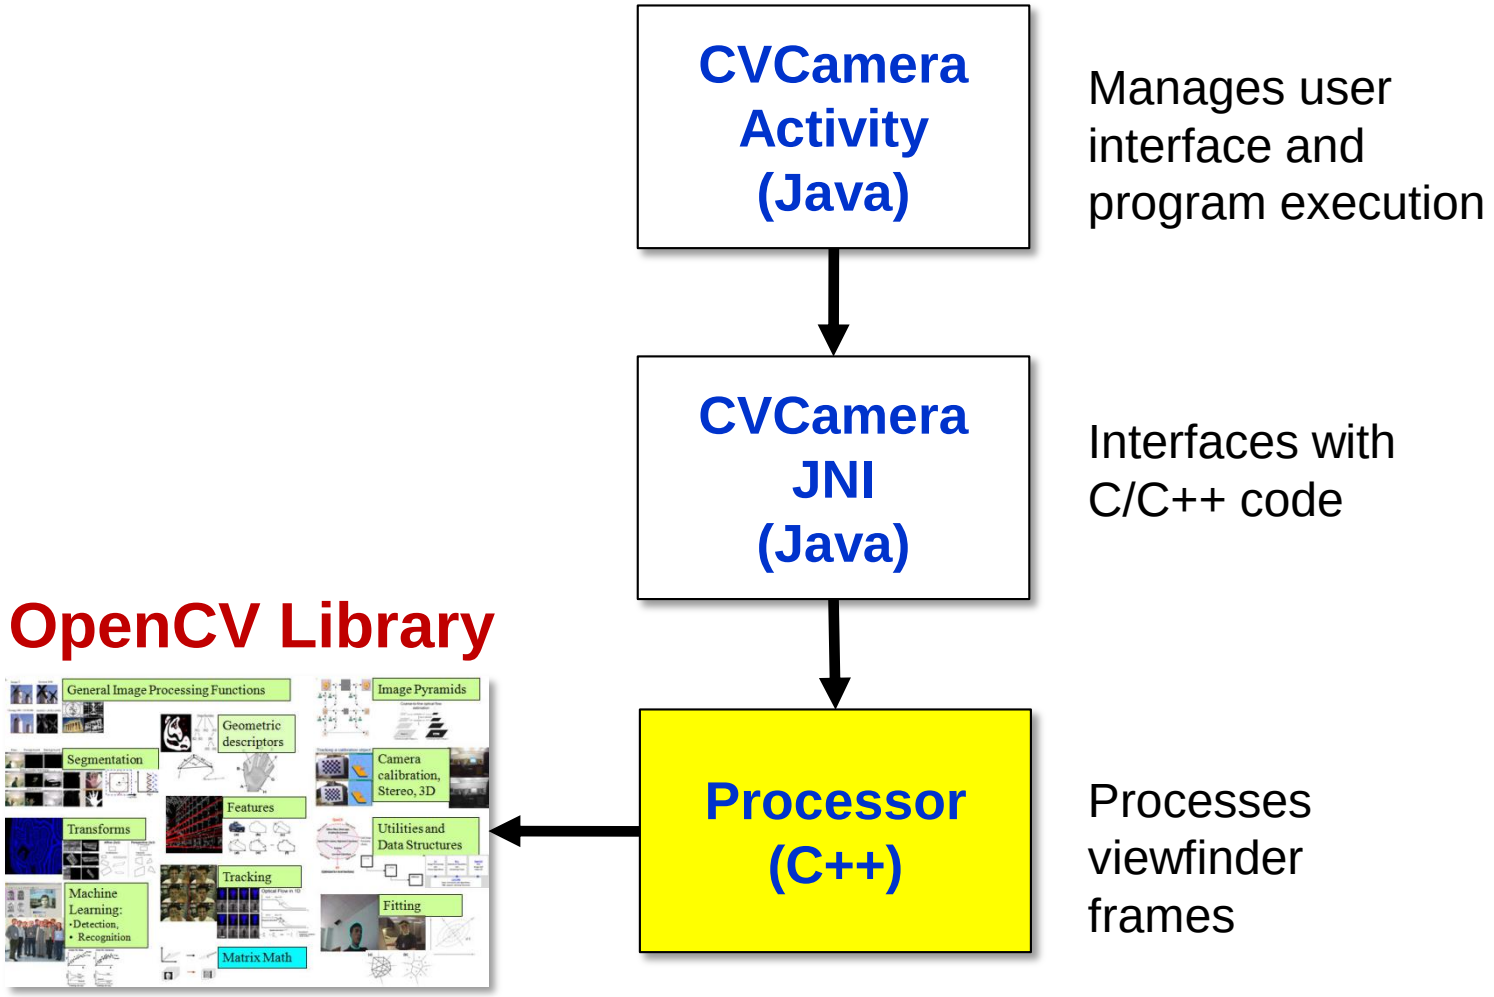
public final static native int DETECT_FAST_get();
public final static native int DETECT_STAR_get();
public final static native int DETECT_SURF_get();
public final static native int DETECT_MSER_get();
public final static native long new_Processor();
public final static native void delete_Processor(long jarg1);
```

Java Code

Load libraries built by the Android NDK

Function prototypes for interface to C/C++ side

“CVCamera” class hierarchy



Processor class: initialize feature detectors

```
class Processor {
private:
  cv::StarFeatureDetector my_stard;
  cv::FastFeatureDetector my_fastd;
  cv::SurfFeatureDetector my_surfd;
  cv::MserFeatureDetector my_mserd;
  std::vector<cv::KeyPoint> my_keypoints;

public:
  Processor():
    my_stard(STAR detector parameters),
    my_fastd(FAST detector parameters),
    my_surfd(SURF detector parameters),
    my_mserd(MSER detector parameters)
    {}
  void detectAndDrawFeatures
    (int idx, image_pool* pool, int feature_type);
};
```

C++ Code

Different feature extractors stored as members

Initialize extractors in the class instantiation list

Function for detecting and drawing keypoints

Processor class: detect and draw feature keypoints

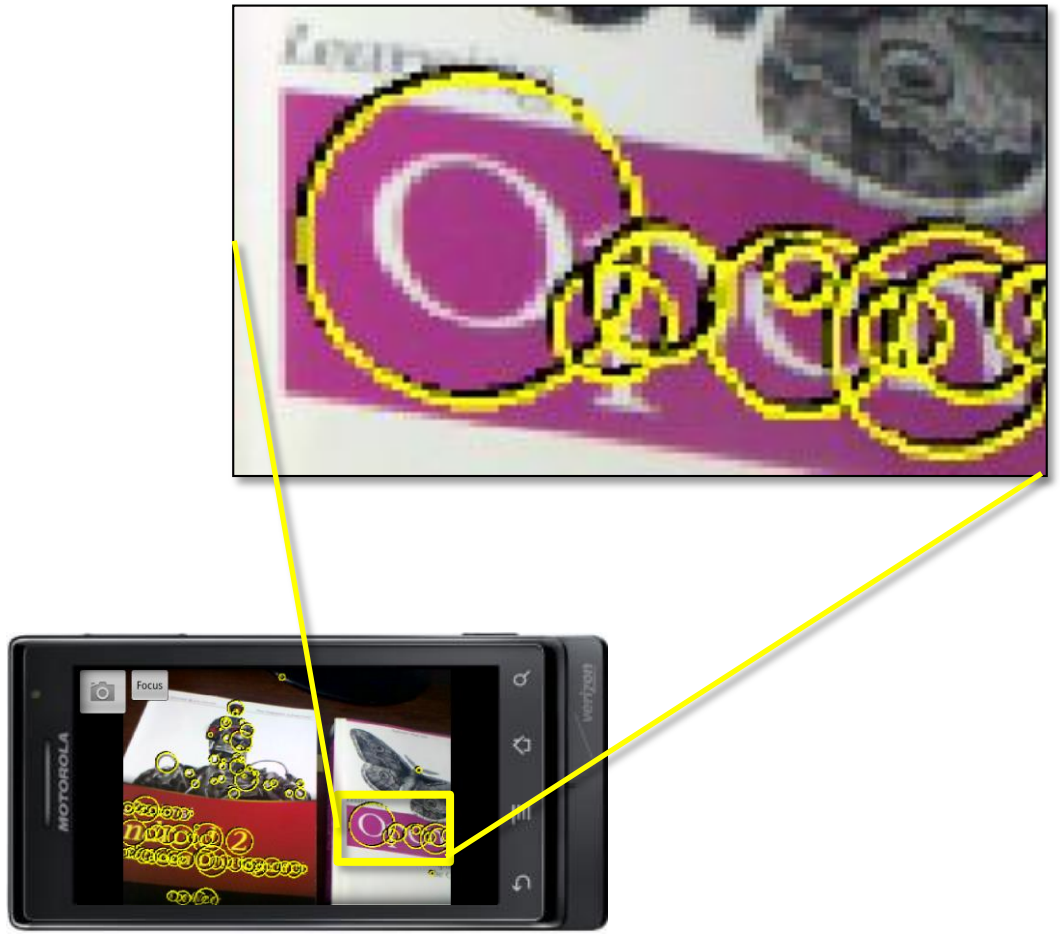
```
// Detect feature keypoints
Mat grey_im = pool->getGrey(idx);
Mat color_im = pool->getImage(idx);
my_keypoints.clear();
my_mserd->detect(grey_im, my_keypoints);

// Draw feature keypoints
vector<KeyPoint>::const_iterator it;
for (it = my_keypoints.begin();
     it != my_keypoints.end(); ++it) {

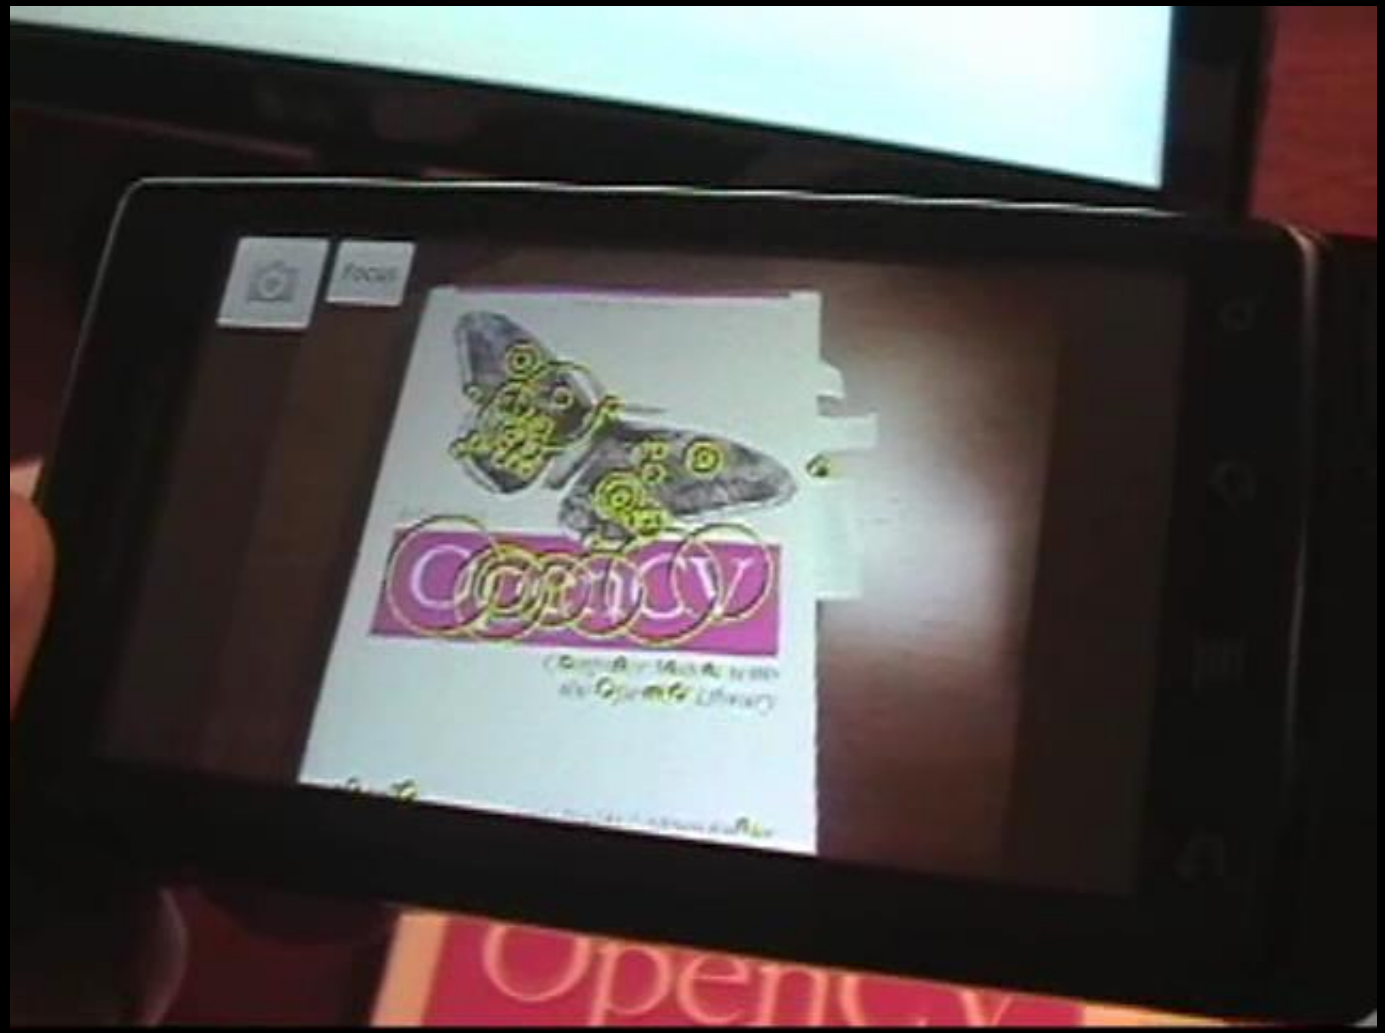
  // Draw black circle
  Point2f pt = it->pt;
  circle(color_im, pt, it->size,
         cvScalar(0,0,0,0), 2);

  // Draw yellow circle
  pt.x += 1;  pt.y += 1;
  circle(color_im, pt, it->size,
         cvScalar(255,255,0,0), 2);
} // iterator
```

C++ Code



Local feature keypoints extraction



Detecting edges, lines, and circles

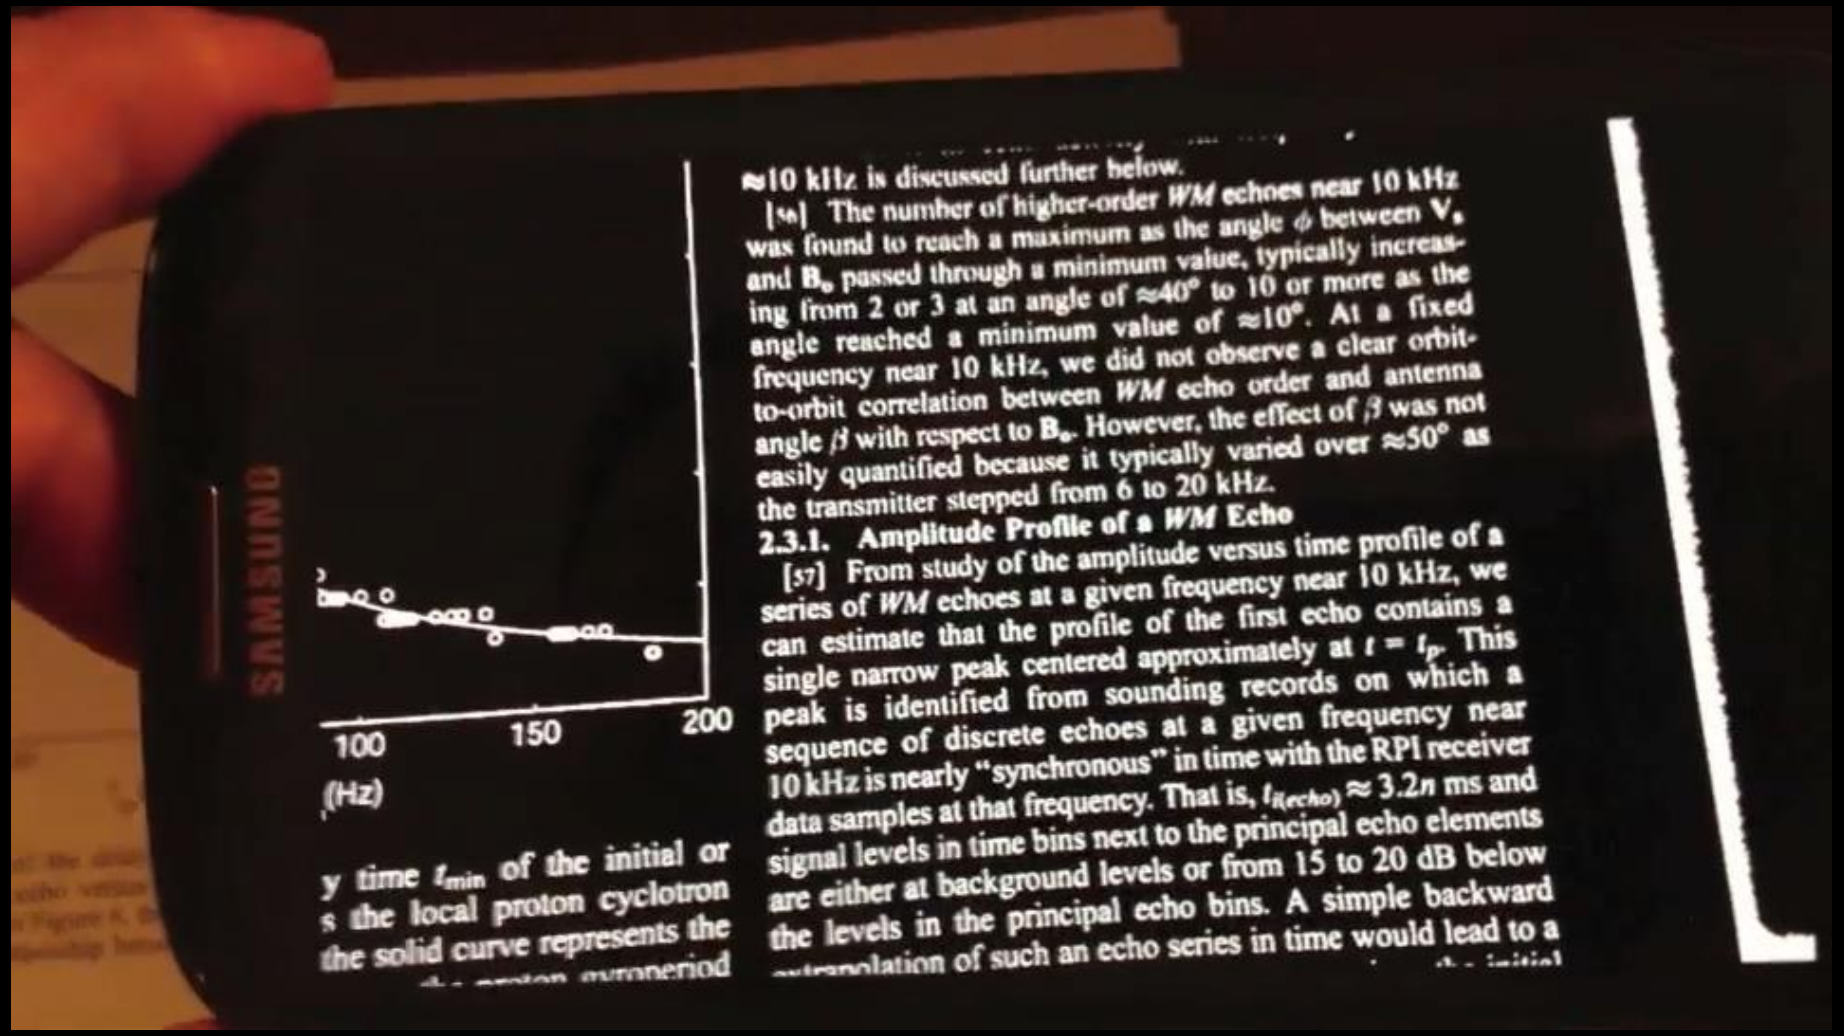
Detecting edges, lines, and circles

```
// Extract Canny edges
C++: Canny(
    InputArray image, OutputArray edges, double threshold1, double threshold2
);
```

```
// Extract lines using Hough transform
C++: HoughLines(
    InputArray image, OutputArray lines, double rho, double theta, int thresh
);
```

```
// Extract circles using Hough transform
C++: HoughCircles(
    InputArray image, OutputArray circles, int method, double accumRatio, double minDist
);
```

Locally adaptive binarization



≈10 kHz is discussed further below.

[56] The number of higher-order *WM* echoes near 10 kHz was found to reach a maximum as the angle ϕ between $\mathbf{V}_e$ and $\mathbf{B}_o$ passed through a minimum value, typically increasing from 2 or 3 at an angle of ≈40° to 10 or more as the angle reached a minimum value of ≈10°. At a fixed frequency near 10 kHz, we did not observe a clear orbit-to-orbit correlation between *WM* echo order and antenna angle β with respect to $\mathbf{B}_o$. However, the effect of β was not easily quantified because it typically varied over ≈50° as the transmitter stepped from 6 to 20 kHz.

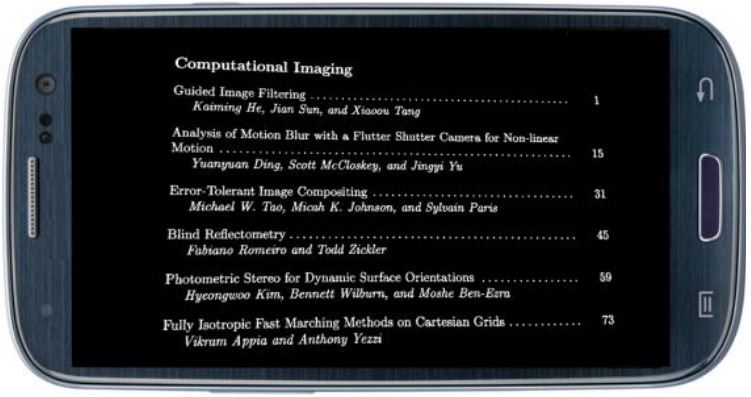
2.3.1. Amplitude Profile of a *WM* Echo

[57] From study of the amplitude versus time profile of a series of *WM* echoes at a given frequency near 10 kHz, we can estimate that the profile of the first echo contains a single narrow peak centered approximately at $t = t_p$. This peak is identified from sounding records on which a sequence of discrete echoes at a given frequency near 10 kHz is nearly "synchronous" in time with the RPI receiver data samples at that frequency. That is, $t_{i(echo)} \approx 3.2n$ ms and signal levels in time bins next to the principal echo elements are either at background levels or from 15 to 20 dB below the levels in the principal echo bins. A simple backward extrapolation of such an echo series in time would lead to a

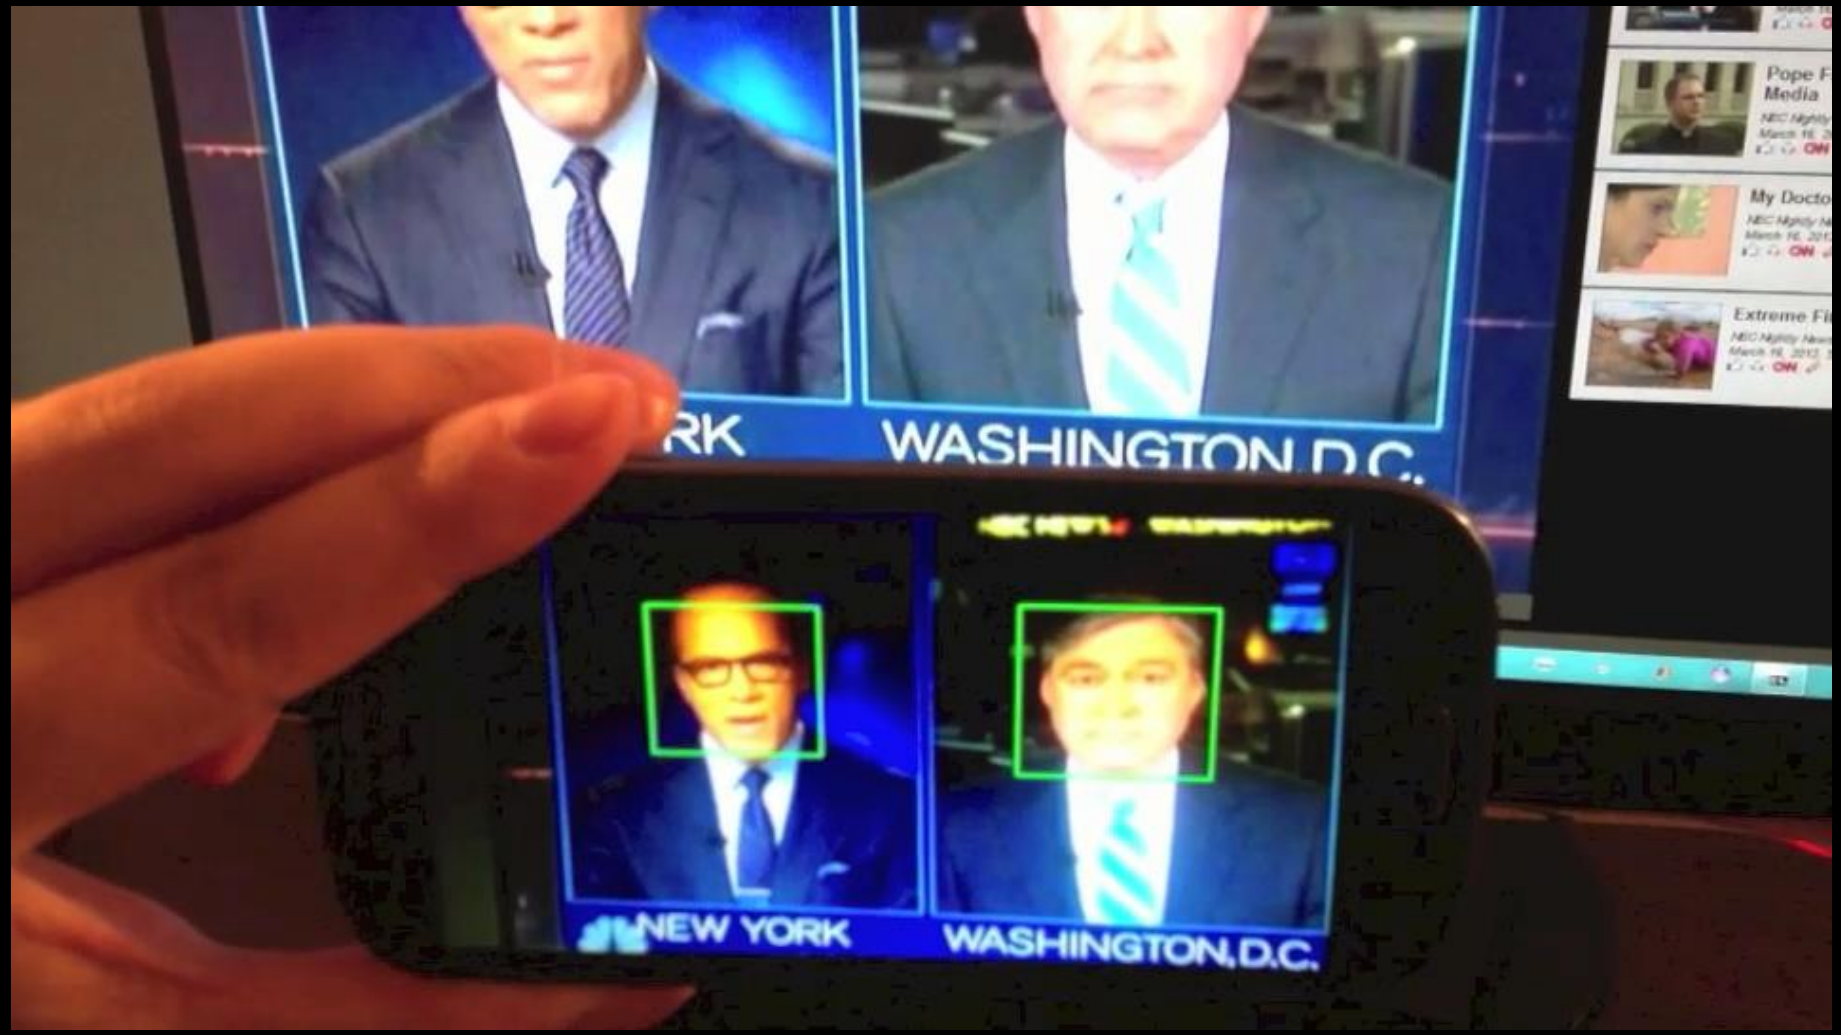
y time t_{min} of the initial or
s the local proton cyclotron
the solid curve represents the

Locally adaptive binarization

```
// Perform locally adaptive binarization
C++: adaptiveThreshold(
    InputArray src, OutputArray dst, double maxValue, int adaptiveMethod,
    int thresholdType, int blockSize, double valOffset
);
```



Human face detection



Human face detection

```
// Call Viola-Jones face detector
vector<Rect> RectFaces;
((DetectionBasedTracker*)this)->process(*((Mat*)imageGray));
((DetectionBasedTracker*)this)->getObjects(RectFaces);
for (int nFace = 0; nFace < RectFaces.size(); nFace++) {
       rectangle(imageColor, RectFaces[nFace], cvScalar(255,255,0,0));
} // nFace
```
