Distributed Computing with Spark and MapReduce

Reza Zadeh
Problem

Data growing faster than processing speeds

Only solution is to parallelize on large clusters

» Wide use in both enterprises and web industry

How do we program these things?
Outline

Data flow vs. traditional network programming
Limitations of MapReduce
Spark computing engine
Current State of Spark Ecosystem
Built-in Libraries
Data flow vs. traditional network programming
Traditional Network Programming

Message-passing between nodes (e.g. MPI)

Very difficult to do at scale:
» How to split problem across nodes?
  • Must consider network & data locality
» How to deal with failures? (inevitable at scale)
» Even worse: stragglers (node not failed, but slow)
» Ethernet networking not fast
» Have to write programs for each machine

Rarely used in commodity datacenters
Disk vs Memory

L1 cache reference: 0.5 ns
L2 cache reference: 7 ns
Mutex lock/unlock: 100 ns
Main memory reference: 100 ns
Disk seek: 10,000,000 ns
Network vs Local

Send 2K bytes over 1 Gbps network: 20,000 ns
Read 1 MB sequentially from memory: 250,000 ns
Round trip within same datacenter: 500,000 ns
Read 1 MB sequentially from network: 10,000,000 ns
Read 1 MB sequentially from disk: 30,000,000 ns
Send packet CA->Netherlands->CA: 150,000,000 ns
Data Flow Models

Restrict the programming interface so that the system can do more automatically.

Express jobs as graphs of high-level operators:
- System picks how to split each operator into tasks and where to run each task.
- Run parts twice for fault recovery.

Biggest example: MapReduce.
MapReduce + GFS

Most of early Google infrastructure, tremendously successful

Replicate disk content 3 times, sometimes 8

Rewrite algorithms for MapReduce
Diagram of typical cluster

http://insightdataengineering.com/blog/pipeline_map.html
Example MapReduce Algorithms

Matrix-vector multiplication
Power iteration (e.g. PageRank)
Gradient descent methods
Stochastic SVD
Tall skinny QR

Many others!
Why Use a Data Flow Engine?

Ease of programming
  » High-level functions instead of message passing

Wide deployment
  » More common than MPI, especially “near” data

Scalability to very largest clusters
  » Even HPC world is now concerned about resilience

Examples: Pig, Hive, Scalding, Storm
Limitations of MapReduce
Limitations of MapReduce

MapReduce is great at one-pass computation, but inefficient for *multi-pass* algorithms.

No efficient primitives for data sharing:

- State between steps goes to distributed file system
- Slow due to replication & disk storage
Example: Iterative Apps

Input

file system read
iter. 1
file system read
iter. 2
file system write

query 1
result 1
query 2
result 2
query 3
result 3

Commonly spend 90% of time doing I/O
Example: PageRank

Repeatedly multiply sparse matrix and vector

Requires repeatedly hashing together page adjacency lists and rank vector

neighbors (id, edges)

ranks (id, rank)

iteration 1

iteration 2

iteration 3

Same file grouped over and over
Result

While MapReduce is simple, it can require asymptotically more communication or I/O
Verdict

MapReduce algorithms research doesn’t go to waste, it just gets sped up and easier to use

Still useful to study as an algorithmic framework, silly to use directly
Spark computing engine
Spark Computing Engine

Extends a programming language with a distributed collection data-structure
» “Resilient distributed datasets” (RDD)

Open source at Apache
» Most active community in big data, with 50+ companies contributing

Clean APIs in Java, Scala, Python, R
Resilient Distributed Datasets (RDDs)

Main idea: Resilient Distributed Datasets
- Immutable collections of objects, spread across cluster
- Statically typed: RDD[T] has objects of type T

```scala
val sc = new SparkContext()
val lines = sc.textFile("log.txt")  // RDD[String]

// Transform using standard collection operations
val errors = lines.filter(_.startsWith("ERROR"))
val messages = errors.map(_.split("\t")(2))
lazily evaluated

messages.saveAsTextFile("errors.txt")
kicks off a computation
```
Key Idea

Resilient Distributed Datasets (RDDs)
» Collections of objects across a cluster with user controlled partitioning & storage (memory, disk, ...)  
» Built via parallel transformations (map, filter, ...)  
» The world only lets you make make RDDs such that they can be:

Automatically rebuilt on failure
Python, Java, Scala, R

// Scala:
val lines = sc.textFile(...)
lines.filter(x => x.contains("ERROR")).count()

// Java (better in java8!):
JavaRDD<String> lines = sc.textFile(...);
lines.filter(new Function<String, Boolean>() {
    Boolean call(String s) {
        return s.contains("error");
    }
}).count();
Fault Tolerance

RDDS track *lineage* info to rebuild lost data

```python
file.map(lambda rec: (rec.type, 1)).
  .reduceByKey(lambda x, y: x + y).
  .filter(lambda (type, count): count > 10)
```
Fault Tolerance

RDDs track *lineage* info to rebuild lost data

```python
file.map(lambda rec: (rec.type, 1))
  .reduceByKey(lambda x, y: x + y)
  .filter(lambda (type, count): count > 10)
```
Partitioning

RDDS know their partitioning functions

\[
\text{file.map}(\lambda \text{rec}: (\text{rec.type}, 1)) \\
\quad \text{.reduceByKey}(\lambda x, y: x + y) \\
\quad \text{.filter}(\lambda (\text{type, count}): \text{count} > 10)
\]

Known to be hash-partitioned

Built-in libraries
Standard Library for Big Data

Big data apps lack libraries of common algorithms

Spark’s generality + support for multiple languages make suitable to offer this

Much of future activity will be in these libraries
A General Platform

Standard libraries included with Spark

Spark SQL structured
Spark Streaming real-time
GraphX graph
MLlib machine learning

Spark Core
Machine Learning Library (MLlib)

points = context.sql("select latitude, longitude from tweets")
model = KMeans.train(points, 10)
MLlib algorithms

classification: logistic regression, linear SVM, naïve Bayes, classification tree

regression: generalized linear models (GLMs), regression tree

collaborative filtering: alternating least squares (ALS), non-negative matrix factorization (NMF)

clustering: k-means

decomposition: SVD, PCA

optimization: stochastic gradient descent, L-BFGS

General graph processing library

Build graph using RDDs of nodes and edges

Large library of graph algorithms with composable steps
Spark Streaming

Run a streaming computation as a series of very small, deterministic batch jobs

- Chop up the live stream into batches of X seconds
- Spark treats each batch of data as RDDs and processes them using RDD operations
- Finally, the processed results of the RDD operations are returned in batches
Spark Streaming

Run a streaming computation as a series of very small, deterministic batch jobs

- Batch sizes as low as ½ second, latency ~ 1 second
- Potential for combining batch processing and streaming processing in the same system
Spark SQL

// Run SQL statements
val teenagers = context.sql("SELECT name FROM people WHERE age >= 13 AND age <= 19")

// The results of SQL queries are RDDs of Row objects
val names = teenagers.map(t => "Name: " + t(0)).collect()
Spark SQL

Enables loading & querying structured data in Spark

From Hive:

c = HiveContext(sc)
rows = c.sql("select text, year from hivetable")
rows.filter(lambda r: r.year > 2013).collect()

From JSON:

c.jsonFile("tweets.json").registerAsTable("tweets")
c.sql("select text, user.name from tweets")

tweets.json

{"text": "hi",
 "user": {
 "name": "matei",
 "id": 123
 }}
